3.3.1	Governance and advisory structures	45
3.3.2	Involvement of the European Commission	47
3.4	Openness and transparency	47
3.4.1	How will the partnership establish a broad, open and transparent approach towards different sectors and geographical areas	47
3.4.2	How will the partnership ensure easy and non-discriminatory access to information about the initiative and dissemination of and access to results	48
3.4.3	How will the partnership establish a proactive recruitment policy	48
3.4.3	Process for establishing annual work programmes	49
	Annexe 1 Contributions	50
	CWG Animal Health & Welfare	50
	Collaborating entities	50
	Working groups	50

Preamble

The present document is based on the version drafted in May 2020 (v2.6), which was assessed and commented on by the Directorate General Research and Innovation (DG RTD) services in June 2020. In the autumn of 2020 and the spring of 2021 Directorate General Agriculture and Rural Development (DG AGRI) as the lead DG, together with the chair of the SCAR Collaborative Working Group on Animal Health and Welfare Research (CWG AHW¹) set up a core group and working groups with European experts and in which the European Food Safety Authority (EFSA²), the World Organisation for Animal Health (OIE³)

¹ www.scar-cwg-ahw.org

² www.efsa.europa.eu/fr

³ www.oie.int/en/home/

and the animal health industry (AnimalhealthEurope⁴ and Diagnostics for Animals⁵) and the SCAR CWG on fisheries and aquaculture research (SCAR FISH⁶) were represented. The outcome of the expert working groups was presented during a full day online webinar on 29 June 2021 with contact persons designated by countries for the partnership, additional potential actors, CWG AHW members and experts, Commission services and stakeholders. It was followed by an online consultation and online meetings with CWG AHW on 25 August, 28 September, 9 November 2021 and 16 December.

Update on progress was provided to SCAR Plenary on 30 June and on 7 December. A webinar was organised on 17 December to discuss the pre-final draft document with SCAR members, Cluster 6 Programme Committee members, contact persons designated by countries for the partnership, and associated Commission Services.

This document, finalised after the last meetings above, follows to a large extent the template provided by DG RTD.

The candidate European Partnership Animal Health & Welfare (PAHW) is listed in the Horizon Europe Strategic Plan 2021-2024. It is planned to be a Co-Funded partnership to be published in the Horizon Europe 2023-2024 work programme. The present document reflects the currently agreed vision, objectives, estimated impact and governing model of this candidate partnership.

The industrial partners that the authors contacted in preparation of this document support the approach to future R&D options for animal health and welfare as outlined in this version of the proposal.

livestock and aquaculture. It will reduce the risk of animal infections threatening public health by enhancing cross-sector collaboration in a One Health perspective.

PAHW will reinforce the preparedness of all actors and stakeholders, and support evidence-based intervention and policy making in the fields of animal health and welfare.

2 Context, objectives, expected impacts

2.1 Context and problem definition

Animal health and animal welfare constitute a Global Public Good; its preservation and continuous improvement is the mission of the proposed PAHW. The creation of the partnership is timely, as never before has the need for such an initiative been so pressing and the opportunity of achieving significant and sustainable progress been so favourable in the context of the Farm to Fork strategy. The challenges at hand and the mobilisation of resources to achieve them require a systemic, cross-cutting, interdisciplinary and coordinated approach at the transnational level.

The **livestock sector plays a major economic role** in agriculture, accounting for €168 billion annually, 45% of total EU agricultural activities, creating 4 million jobs, many of them in rural areas, while linked sectors (dairy products, eggs and meat processing, feed for livestock) have an annual turnover of approximately €400 billion. The value of EU aquaculture production reached €5.6 billion in 2017.

Around 20% of **animal production loss** is related to animal diseases worldwide⁷. Reducing the burden of diseases would improve the availability of resources, which is all the more important for the ever-growing human population, expected to have reached 10 billion people by 2050. Despite the increasing use and development of alternative proteins for food and changing eating habits, livestock and aquaculture remain of great importance for food production since they **provide proteins of high nutritional values** including meat, fish, crustacean and mollusc, milk and eggs, contributing to food security (SDG2) and nutrition (SDG3). Furthermore, animal production enhances economic growth (food and non-food products) (SDG8), rural development and vitality of many EU marginal territories (SDG9, SDG15) and certain production systems preserve biodiversity on earth (SDG2, SDG15). A healthy and sustainable livestock and aquaculture sector is a prerequisite for providing sufficient and healthy food to citizens and for establishing well-functioning circular sustainable agri/food systems, in the most efficient possible way. The likely increase in animal production, however, will create new challenges, especially with regard to disease prevention and control, as well as animal welfare.

The One Health principle recognises that human, animal including fish, plant and environmental health are closely linked⁸. If one group is affected, this influences the health of the rest. In a One Health perspective, certain animal **infectious** diseases (AID) have an impact, directly or indirectly, on public health. Indeed, the majority of emerging AID are zoonotic⁹, i.e. transmissible between animals and humans, directly or indirectly (e.g. food-

borne and vector-borne zoonoses). In a global study¹⁰ 56 zoonoses were assessed, which were together responsible for an estimated 2.5 billion cases of human illness and 2.7 million human deaths per year. EFSA has estimated that the overall economic burden of human salmonellosis could be as high as €3 billion a year. The COVID-19 pandemic has underlined the importance of a robust and resilient food system that functions in all circumstances, and is capable of ensuring access to a sufficient supply of affordable food for all citizens¹¹. It has also made us acutely aware of the interrelations between our health, ecosystems, animal reservoirs, supply chains, consumption patterns and planetary boundaries. Spread and emergence of resistant bacteria also arise in the environment, due to pharmaceutical leaks, pollution, organic fertilizers, etc. and are passed onto livestock¹². It is clear that we need to do much more to keep ourselves and our planet healthy. The increasing recurrence of droughts, floods, forest fires and new pests are a constant reminder that **our food system is under pressure** and has to evolve towards more sustainability and resilience.

One Welfare emphasises the link between animal welfare, human wellbeing and ecosystem health. Furthermore, animal welfare being linked to animal health, the One Welfare concept complements the One Health concept. Integrating this concept in future projects will foster interdisciplinary collaboration to improve human and animal welfare and help improve global standards of both human wellbeing and animal welfare.

2.1.1 Problems in animal health and welfare

Global change, problems and their causes

Global change has accelerated in recent decades leading to far-reaching climatic, economic, sociological and environmental consequences. Animal populations, whether domestic or wild, terrestrial or aquatic, lie at the heart of ecosystems, along with plants, air, water and soil. The populations are confronted with new and more complex challenges in relation to climate change, ecological transformation and habitat loss. Furthermore, demands for increasing efficiency of animal farming and husbandry practices and increased trade to meet the growing demands of developing societies pose additional challenges. Rising temperatures affect the physiology of both animals and pathogens, in both aquatic and terrestrial production, and have the potential to lead to significant increases in disease outbreaks, welfare breaches, and antimicrobial resistance^{13,14} (AMR) within livestock and aquaculture systems, resulting in severe financial impacts¹⁵. Similarly, deforestation transforms the interactions between pathogens, arthropod vectors and hosts in multiple and complex ways leading to spread and emergence of infectious diseases.

¹⁵ Mediterranean Aquaculture in a Changing Climate: Temperature Effects on Pathogens and Diseases of Three Farmed Fish Species. <https://doi.org/10.3390/pathogens10091205>

Many AID are transboundary and in recent decades there has been a surge in the emergence or re-emergence of endemic or epidemic animal diseases, and increasing numbers of exotic (including zoonotic) diseases are reaching Europe. Climate change increases the risk of emergence and spread of vector-borne diseases, e.g. bluetongue disease, West Nile fever (WNV), lumpy skin disease (LSD). Movement of infected individuals or contaminated fomites, or changes in the range of vectors or wildlife reservoirs can result in spread and establishment of emerging infections. The rate of **emergence of novel pathogens**, whether viruses, bacteria, parasites, fungi, or prions, has increased in the last decades due to exacerbation of drivers of emergence, such as globalisation and climate change and other factors, for example, human population expansion into wildlife refuges bringing people and livestock in contact with wildlife carrying potential pathogenic microorganisms. It seems that biodiversity could also act as a shield in this area¹⁶. Other emergent risks hitherto unknown to European regions have been the sudden emergence of bluetongue disease type 8 and Schmallenberg virus (SBV), and the migration of lumpy skin disease up through the European Southeast, its further spread being prevented by vigorous vaccination. The spread of African swine fever (ASF) into as yet unaffected European territories is a constant risk due to global trade and travels. The introduction of porcine epidemic diarrhoea (PEDV), another fatal porcine infectious disease, into Europe is an indicator of a looming risk at the horizon. Regarding influenza, re-assortment between different strains harboured in e.g. pigs, can lead to new subtypes with the ability to spread between humans, as seen in 2009 during the worldwide H1N1 influenza pandemic. The COVID-19 pandemic, with a suspected origin in wildlife, transmission to humans and spread to farmed animals (e.g. fur production animals¹⁷) and back to wildlife species¹⁸ has shown how far systems of surveillance, prevention and response are a challenge for such health systems and need to be improved, by applying a consistent "One-Health" approach¹⁹.

On the aquatic side, emerging diseases are also having an important impact on animal health for both finfish and bivalve molluscs, as witnessed by the emergence of infectious salmon anaemia, infectious haematopoietic necrosis. Photobacteriosis, caused by *Photobacterium damsela* subsp, which until recently was a minor issue in aquaculture, has now emerged as major problem in the Mediterranean aquaculture, with new virulence factors linked to increasing water temperatures.

Emergence and spread of AID can have serious consequences not only for the sustainability of livestock and aquaculture/fish farming, but also for public health²⁰, as a

significant number of infectious agents affecting animals have zoonotic potential, with or without showing disease in the animal host.

Microorganisms may cross species barriers, e.g., highly pathogenic avian influenza (HPAI), Middle East respiratory syndrome (MERS), SARS-CoV-2, Nipah virus infection, Hepatitis E, sometimes affecting humans through zoonotic spill-over²¹, even leading to the emergence of new forms of diseases in new species or larger epidemics after establishing human-to-human transmission chains.

Costs and consequences of AID

Major epidemics, e.g. foot and mouth disease (FMD), bovine spongiform encephalopathy (BSE), classical swine fever (CSF), HPAI, and more recently ASF, entail costs of several hundred million (HPAI), sometime billions of Euros (FMD, BSE, ASF). Also, many infectious diseases are endemic and less ‘visible’, yet extremely costly, mainly to farmers but also to society and contribute to environmental impact. For instance, the annual costs inflicted by coccidiosis, a common AID in commercial poultry, have been estimated at €2 billion²² worldwide. Similarly, the economic impact of necrotic enteritis in poultry is estimated at US\$ 2 billion per year due to death, poor performance and cost of prevention and treatment²³. Porcine reproductive and respiratory syndrome (PRRS), a global problem affecting the swine industry worldwide, leads to reproductive failure and causes pneumonia and increased mortality in young animals. In 2013, it was estimated that the annual costs of PRRS in Spain, Germany and Denmark were €324 million, €275 million and €63 million respectively, and in the US amounted to \$664 million (\$115 per sow and \$5.6 per pig)²⁴ The cost of gastrointestinal nematode infections with resistance against macrocyclic lactones was estimated to be €38 million [€11–87 million] annually²⁵. On a global scale, economic losses in aquaculture due to diseases are estimated to amount to at least several billion US\$ per year (World Bank, 2014)²⁶.

For the period 2007-2013, more than €1 billion was allocated by the EU to fund animal health measures in the MS, from emergency measures to programmes for the eradication, control and surveillance of animal diseases and zoonoses.²⁷ The amount is comparable for

the period 2014-2021²⁸. Up to the end of 2021, € 230 million were devoted to ASF related measures.

In addition, sick animals are often treated with antibiotics, promoting the development of AMR, further therapy failure in the population and additional costs.

Beyond direct costs and losses, AID can lead to major crises disturbing animal-based food trade and supply, affecting public health and jeopardising consumer confidence. The salmonella in eggs scare of the late 80s in the UK is an illustration. At the time of the BSE and AI crises or other zoonotic and food-borne diseases, a serious drop in meat consumption occurred, obliging EU and national authorities to implement costly market support measures. Under the current ASF situation, exports of pork are banned from countries/regions where ASF occurs, significantly threatening the pig farming sector in those countries/regions.

Animal welfare, problems and causes

Poor animal welfare impacts the health of animals. There is a link, insufficiently addressed by research so far, between animal health, animal welfare, and production conditions. While poor animal health is obviously detrimental to animal welfare, animals that are poorly managed (e.g. stress) are more likely to develop certain diseases and lesions. Faster animal turnover, areas with high livestock population density and habitat fragmentation without concurrent improvement of biosecurity measures and control tools can increase both the likelihood as well as the impact of outbreaks of emerging diseases including zoonoses.

Societal demand for improved animal welfare develops apace, as the ‘End the Cage Age’ European Citizens’ Initiative (ECA) demonstrated²⁹, with 1.4 million validated signatures. There is growing public concern about rearing of livestock in cages, animal transports and slaughter.

Beyond practices that are already widely criticized or rejected (e.g. piglet castration and tail docking, beak-trimming), or systems decried for producing animals of very low economic value (e.g. male dairy calves, male day old chicks of laying lines), the acceptability of other aspects of animal management (for instance intensive farming, housing, high mortalities of young animals, handling of animals during transport and in the slaughterhouse, harvesting and slaughtering of farmed fish) is being called into question.

Other welfare challenges include alternative housing systems (e.g. outdoor, mixed farming, organic farming, re-circulatory aquaculture systems) and increased risk of transmission of pathogens between wildlife and production animals, as well as a reduction in economic profitability when competing with conventional production systems, which currently forms a major barrier in introducing more welfare-friendly production systems.

There is also a need to address the use of animals in research and health product development through the 3R principles, i.e. replacement (e.g. with animal free models such as organoids, in silico), reduction and refinement.

There is a considerable **lack of data on the status of animal welfare** in the European Union, and the prevalence of welfare problems. Currently, only a limited amount of welfare data is routinely collected, and most of those are related to animal health or food safety issues. The main obstacles for welfare data collection include the lack of standardisation of animal-based measures (despite substantial progress being made through EU funded projects such as Welfare Quality®, or AWIN), and the time and expense it takes to collect them. Other problems relate to the relative weights and importance that should be given to the various

²⁸ https://ec.europa.eu/food/horizontal-topics/funding-procurement-grants_en

²⁹ <https://www.endthecageage.eu/>

indicators to judge if overall welfare is good or bad. Knowledge on welfare challenges within the aquaculture sector is even more scarce. These obstacles need to be addressed.

Although the **EU legislation on animal welfare** is recognised globally as advanced, it has not been kept up to date with new scientific knowledge nor the changes in societal perceptions. The latest main legislative act on animal welfare was published in 2009. For several farmed species, there is no detailed welfare legislation. The Commission set out plans for a legislative proposal to prohibit cages for a number of farm animals. The proposal will come as part of the ongoing revision of the animal welfare legislation. The usually low benefit margins of farmers in the animal production sector in a global market, make it difficult for farmers to invest in better animal welfare. The transition process to implement these new rules, the associated technical knowledge and practical solutions to adopt and accept new husbandry and management practices will take time and resources, which may not readily be available within the sector or individual MS.

Antimicrobial resistance and chemicals, problems and causes

The use of chemicals, particularly pharmaceuticals, including antibiotics, has contributed to the development of the livestock sector. However, their unjustified or excessive use contributes to the emergence of AMR in pathogens, zoonotic agents and the commensal flora and their potential vectors, which has led to a therapeutic deadlock, with severe consequences for animal and public health³⁰. This dilemma applies also to other domains, e.g. resistance against anti-parasitic treatments such as anthelmintics³¹ and acaricides³², harmful effects on invertebrates, etc.

The environment plays a role in the emergence and spread of AMR in animals and conversely certain practices may increase the risks of AMR emergence in the environment (e.g. disposal of manure)³³ as well as of contamination (pharmaceutical leaks, pollution³⁴, etc.).

The fight against AMR in a One Health approach requires a number of actions, not least to reduce the (need to) use antimicrobials (AMs) in both human and veterinary medicine. The market conditions are such that the innovation pipeline is already drying up in the medical domain, but the situation is even worse for the veterinary sector, where highly critical AMs for human health are subject to extreme restrictions for use in veterinary medicine. Antimicrobial resistance arising from antimicrobial usage (AMU) is a health threat for which veterinary medicine can contribute to find a solution.

Costs and consequences of antimicrobial resistance

By reducing the effectiveness of antimicrobial treatment, AMR in bacterial or parasite populations threatens the control of both animal and human infectious diseases. AMR is responsible for an estimated 33,000 human deaths per year in the EU³⁵. It is also estimated that AMR costs the EU €1.5 billion per year in healthcare costs and human productivity

losses³⁶. Sales of antibiotics for use in animals in Europe decreased by 34% between 2011 and 2018 (although the situation remains contrasting among countries³⁷).

Unfortunately, the animal health industry is far from having the capacity to invest and bring new AMs on the market, mainly due to regulatory hurdles and likelihood that new, effective AMs will be reserved for human use.

2.1.2 General challenges for animal health and welfare

Societal and economical challenges

An important challenge for health and welfare of animals rests in the socio-economic conditions under which animal production takes place. The social vulnerability of the livestock and aquaculture sectors linked to the loss of public and consumers' confidence, the loss of productivity through endemic and emerging AID, or even the abandonment of the livestock/fish farming by future generations has an impact at individual, family or community level, which is difficult to quantify. There is fierce competition and economic margins at primary production are usually low. The average income of farmers represents 45% of the average wage in the EU in 2018 (source: Common Agriculture Policy (CAP) indicators), and the income of livestock farmers is usually at the lower end within the agriculture sector³⁸. This applies pressure for increasing productivity and decreasing costs, which can have an impact on capacity or willingness to invest in health and welfare related matters by the farmers, especially when third-country production is not asked to reach the same high standard. Similarly, it is a limiting factor for the animal health industry to develop products: in 2018, the global animal healthcare market (pharmaceuticals, vaccines, feed, diagnostic) was estimated to be about €35 billion (current prices), representing only 3.5-3.8% of the human medicine market³⁹. In consequence, innovative solutions are required to make new veterinary products at an affordable price.

Technological and scientific challenges

New technologies such as omics (e.g. metagenomics and genomics based on next-generation sequencing technologies) and new vaccine/diagnostic platforms are available and scientific progress in microbiology, microbiome knowledge, immunology, vector biology, new therapies and welfare supportive research find their way into the sector of animal health, but these technologies are still complex and expensive (practical locks). Opportunities for innovation undoubtedly exist, but are difficult to implement in this vulnerable sector.

AID control needs constant vigilance and continuous research regarding emergent risks and unceasing refinement of control instruments. Efficacious preparedness is cost- and labour extensive. Each MS cannot develop sustained research on all aspects of all AID in all relevant species; the epidemiological situation may not require it (see 'Political'). However, attenuating the impact of the emergence and spread of a highly pathogenic AID requires efficient preparedness and capacity for early detection in order to respond quickly and efficiently.

36

http://ecdc.europa.eu/en/publications/Publications/0909_TER_The_Bacterial_Challenge_Time_to_React.pdf

37 <https://www.ema.europa.eu/en/veterinary-regulatory/overview/antimicrobial-resistance/european-surveillance-veterinary-antimicrobial-consumption-esvac>

38 In 2015, income per farm stood at the average of the EU farm income for dairy farms, above the average for granivore and was lowest for grazing livestock farms and also mixed-farms (DG AGRI, FADN data).

39 [Global Benchmarking Survey 2020 – Report for Europe](#)

Environmental and epidemiological challenges

Microorganisms are constantly evolving, spontaneously or under the influence of environmental factors, including other microorganisms, the host, treatments, chemical compounds, residues, or biocides, increasing water temperatures, etc. Those conditions promote the generation of populations with new ecological features and pathogenic microorganisms may become less or more virulent, or develop resistance to treatments (e.g. AMR, anthelmintic resistance).

Structural and political challenges

While the EU regulatory and policy framework aims to ensure a high level of animal health and welfare, it can be a hurdle for research and innovation:

- The animal health standards in the EU are generally high, and a number of epidemic diseases are absent from Europe, although some disease incursions require temporary eradication measures. Depending on the disease and the epidemiological situation, certain AID may be controlled, notably by vaccination. However, in certain cases, the default control strategy for regulated AID in Europe is a ‘sanitary policy’ (e.g. avian influenza, bovine tuberculosis, etc.), with testing and elimination of infected animals, which facilitates faster recovery of export access. Indeed, the use of vaccines against certain AID influences the health status of countries and may hinder the international trade of products. In this framework, the EU as well as the global **market for veterinary products** against regulated diseases, not least for vaccines, **is limited** and provides **little incentive for the industry** to develop such control tools. Public research funding may be needed to progress.
- Each MS tends to maintain its research capacity for policy support. This results in both dilution of scarce resources for many diseases and related issues in many animal species at the level of each country, and a **risk of duplication of research** among MS.
- **Improved animal welfare**, its assessment and implementation remain very important for European citizens and it has **not been sufficiently addressed by the scientific community**.

2.1.3 Main research, development and innovation needs and opportunities

Efforts by the EC and MS to improve the surveillance of, preparedness against and recovery from AID concentrate on regulatory diseases and AMR, and have undoubtedly led to progress. However, past and recent outbreaks (e.g. HPAI, ASF) are showing that more action and coordination are needed in order to improve preparedness⁴⁰ and reduce economic losses due to (re)emerging and endemic infections. In addition, regarding animal welfare, a common European plan for the collection and assessment of data is even less developed. A renewed initiative including research and innovation is needed, as the existing approach to animal health and welfare research proved not fully capable of addressing all issues.

New opportunities are offered by upcoming disciplines (at the interface between scientific fields) and technologies that still require coordination and cooperation of various research and innovation actors to deliver, share and exploit large experiments/data sets.

In addition, there is an increasingly perceived need to build a strategic collaboration between public research and the relevant private sector, notably the animal health industry, to facilitate shared priority setting, undertake fit for purpose research along the continuum from basic

⁴⁰ [Responding to emergencies through preparedness and resilience - OIE - World Organisation for Animal Health](#)

research up to innovation, to avoid duplication and therefore, to encourage complementary developments.

Opportunities to control animal infectious diseases

Intervention on livestock and other relevant animals will have an impact on public health. As an example, a decrease of some 50% in the number of reported human cases of salmonellosis occurred within 10 years of the implementation of the EU Regulation on the control of *Salmonella* in livestock⁴¹. It focussed on poultry, requiring hygienic measures and where necessary, vaccination of animals. In addition to typical prevention and control measures (e.g. biosecurity, surveillance), vaccines offer strong opportunities to improve the control of AIDs, be it to decrease incidence or even to eradicate diseases. Centuries of veterinary advances in the control of rinderpest culminated in 2011 with the FAO and the OIE declaring global eradication of this devastating disease of livestock responsible for continent-wide famine and poverty⁴². This is described as the greatest veterinary achievement of our time. Thanks to repeated EU co-financed oral vaccination campaigns using baits since the late 80s, rabies in foxes was progressively eradicated from fox populations in most of the EU countries, with some cases still arising at the eastern border of the EU. The number of cases in livestock decreased to virtually 0. The threat is nevertheless still present due to incursion of the diseases from non-vaccinated regions/countries. LSD is under control in the EU and neighbouring areas thanks to different measures, including vaccination. Vaccines do not exist for all important diseases (e.g. ASF, several helminth parasites); a number of existing vaccines need to be improved (see below), and related DIVA tests (to differentiate infected from vaccinated animals) developed. For instance, EU funded research is on-going for developing a vaccine against ASF, or a next generation vaccine against LSD⁴³. Improvement in technologies (e.g. genomics, 3 D imaging) and understanding of microbial agent biology, ecology, and their interplay with host (immunology) offer opportunities for development or improvement of vaccines.

Opportunities to improve animal welfare

The conditions under which animal production takes place and the level of animal welfare should be improved, in the first place for ethical reasons, but also to increase health standards. This will decrease needs for veterinary drugs, thus reducing selection of antimicrobial-resistant micro-organisms and improving food safety and quality. More resilient animals can also be bred thanks to genetic selection, as well as through interventions to boost the “right” (protective) immune and metabolic response (immuno-stimulation, host-directed therapies, metabolic rewiring via food).

A better understanding of animal welfare and welfare needs of animals will lead to an adaptation of housing systems and management practices and will contribute to responses to animal needs, and the societal and political demands in this field. The demand is legitimized not only from the ethical standpoint, but also by the role that animal well-being plays in resilience to infectious as well as non-infectious diseases and diminution in animal morbidity and mortality. Also, livestock and fish kept with low welfare standards are less efficient and therefore mean a greater environmental footprint per kg of produced food and a waste of resources, counteracting the UN SDGs. Better animal welfare will provide a better congruence between the consumer expectations and the way the food products they buy are really produced.

⁴¹ EFSA Journal 2019;17(2):5596, 155 pp. <https://doi.org/10.2903/j.efsa.2019.5596>

⁴² Roeder P, Mariner J, Kock R. 2013 Rinderpest: the veterinary perspective on eradication. Phil Trans R Soc B 368: 20120139. <http://dx.doi.org/10.1098/rstb.2012.0139>

⁴³ <https://cordis.europa.eu/project/id/862874>; <https://cordis.europa.eu/project/id/773701>

In response to the demand for a transition to more ethical and sustainable farming systems, the Commission intends to put forward a legislative proposal by the end of 2023 to phase out and finally prohibit the use of cages for all of the animal species and categories referred to in ECA⁴⁴. This change may raise new welfare issues as alternative non-cage systems are developed, for which further reach may be needed. A Commission consultation on the EU legislation on animal welfare was launched on 15 October 2021⁴⁵ and the related inception impact assessment identifies various options for changes in the way animals are farmed, transported and slaughtered as well as proposals for animal welfare labelling including more animal-based measures.

Although animal welfare is not explicitly mentioned in the SDGs, there are strong indications for a mutual beneficial relationship between improving animal welfare and achieving several of the SDGs⁴⁶. This should have potential impact on the representations expressed by farmers and other animal workers (job satisfaction, work facilitation, recognition by society ...) and the development of management and housing conditions that improve animal welfare and human wellbeing.

The Treaty of Amsterdam (1999) recognises animals as sentient beings and calls on the Union itself and Member States, to “pay full regard” to the welfare of animals in agriculture, transport, fisheries etc. Indeed, scientific developments in animal welfare give more insight in sentience of both terrestrial and aquatic animals to support this position. The scientific concept of good welfare has evolved even further, and now includes positive emotions of animals, besides in addition to the well-known “five freedoms of animal welfare”. This implies that farm animals cannot just feel pain or fear, but also value positive experiences. There is a growing body of evidence from so-called cognitive bias studies that choices made by animals are affected by their ‘emotional state’.

Opportunities to fight antimicrobial resistance

Many countries have implemented action plans based on recommendations of international organisations (Tripartite Food and Agriculture Organization (FAO), OIE, World Health Organization (WHO)). The significant fall in AMU in food-producing animals⁴⁷ in a large number of European countries suggests that the measures taken to reduce AMU are proving to be effective. Further efforts are needed, however, to reduce, replace and rethink the use of antimicrobials in livestock production and aquaculture, not least following the target set in the Farm to Fork strategy to reduce overall EU sales of antimicrobials for farmed animals and in aquaculture by 50% by 2030⁴⁸.

Of note, through two workshops organised by the OIE, a list has been established of AID for which the development or improvement of vaccines is predicted to contribute to a reduction

⁴⁸ A Farm to Fork Strategy for a fair, healthy and environmentally-friendly food system. Communication from the Commission to the European Parliament, the Council, the European Economic and Social Committee and the Committee of the Regions COM(2020) 381 final

of the use of antimicrobials⁴⁹. Nevertheless, the need and necessity for potent antimicrobial treatment remain. Despite the risk that new antimicrobials be restricted for use in human health research in novel drug targets and identification and development of new potent antimicrobial substances is indispensable. Market and regulatory aspects form substantial barriers and have to be addressed as well as incentives for research into novel antimicrobials and develop them towards marketability. Prevention and alternative to antimicrobials are essential to enable reduction in AMU.

2.1.4 How PAHW will address the problems and bridge the challenges with opportunities

New opportunities exist – in the form of emerging disciplines and technologies – to not only withstand emerging diseases, but also to make inroads against entrenched diseases and improve animal welfare. The challenges for both the science and management are so vast that they cannot be met by individual countries, nor by single or small groups of actors and stakeholders. An international constellation of disciplines, of private and public sectors, at the pan-European level and beyond is required. A partnership to sustain ambitious and integrated research efforts to support innovation in the control of AID and improved welfare is needed to address the intensifying global threats to our health and seize the opportunities provided by unprecedented developing technologies. The feasibility of such an endeavour is ensured by the existing historical cooperation among public research programmes of the EU Member States.

The regulatory framework on animal health aims to align certain aspects of AID control, e.g. detection and surveillance, which stimulates MS to focus on common priority areas and encourages transboundary cooperation.

Improved preparedness for and response to emerging infectious diseases will be more and more critical. Moreover, changes in husbandry practices in response to animals' needs and societal demand (open-air breeding, natural food...) may also expose animals to new biological threats (pathogens, vectors, wildlife, etc.), but for which mitigation measures exist or can be sought.

In order to address the above-mentioned challenges and opportunities, the PAHW will bring together all major European players in the field of animal health and welfare. The partnership will facilitate high quality research by organising external open calls that will enable new developments and innovations in the field of animal health and welfare. In addition, PAHW will organise internal calls and other activities that will strengthen the cooperation and collaboration of animal health and welfare stakeholders, including competent authorities, in order to enhance their preparedness against future animal disease outbreaks (including zoonotic diseases and AMR) and to reinforce animal welfare of livestock and aquaculture throughout Europe.

To illustrate the limitations of the current system and the need for stronger cooperation among animal health actors in Europe, **African Swine Fever (ASF)** can be used as an example. This viral disease is endemic in a large part of sub-Saharan Africa. There had been incursions of ASF in the south-west of Europe (Spain and Portugal) in the mid-1950s and, with no vaccine being available, it took until 1990 to eradicate ASF from Europe (with the exception of Sardinia, where it remained endemic in some areas).

Until then, the scientific expertise in the EU was concentrated mainly in a few Member States, with limited research performed. At the EU level, some public research was done, notably through EU funded research, but the virus is complex and no efficacious and safe vaccine is in the licensing process until now. It is only when ASF emerged in the north-eastern EU in 2014 and subsequently spread in the EU, to other European countries

49

https://www.oie.int/fileadmin/SST/adhocreports/Diseases%20for%20which%20Vaccines%20could%20reduce%20Antimicrobial%20Use/AN/AHG_AMUR_Vaccines_Apr2015.pdf

outside the EU (including to Asia), that the EU veterinary officers called for urgent strengthened and coordinated research efforts on ASF.

Public and private research sectors are investing to better control the disease, not least to develop a vaccine. The future will tell us if and when those efforts will be successful, but new technologies to decipher the microbial genome and its expression and related manipulation provide new venues for such developments.

The epidemiological situation regarding ASF made it possible to attract funders and mobilise additional budget to launch the ERA-NET on the international coordination of research on infectious animal diseases in 2019: ICRAD⁵⁰.

However, ASF is already imposing huge costs to the sector/EU measured in billions of Euros. Establishing a partnership with a higher level of resources, alignment of research activities and strategic collaboration between actors will contribute to increase preparedness and response capability to efficiently tackle emerging infectious diseases such as ASF in an early stage. The costs of such a partnership are negligible in comparison with the costs of a pan-European ASF outbreak.

2.1.5 Building on past research and existing initiatives

The EU has supported research on animal health and welfare throughout the successive Framework Programmes. While FP6 Thematic Priority (TP) 5 had a focus on food quality and safety, significant research was performed on animal health and welfare, in particular under ‘scientific support to policy’ (Thematic Priority 8). FP7 funded a number of projects on animal health and welfare, welfare being often embedded in other aspects of animal production⁵¹.

The cumulative EU contribution to animal health and welfare research in FP7 under Theme 2 (Food, Agriculture and Fisheries, and Biotechnology) is estimated at around 230 million euros. The investment under H2020 Societal Challenge 2 (Food security, sustainable agriculture and forestry, marine, maritime and inland water research, and the bioeconomy) over the same length of time (7 years) is expected to be comparable⁵².

Collaborative projects were organised in most sectors, in certain cases with the industry, but there were hardly any collaborative projects of pan-European nature and little strategic interaction with industry upstream (few projects seem to have led to uptake by the industry). The European Technology Platform on Global Animal Health⁵³ was put on hold during FP7. Still the DISCONTTOOLS FP7 project⁵⁴ was a tangible result, providing a tool to prioritise specific diseases (over 50) and to inventory not only available tools, but also gaps and needs. DISCONTTOOLS is now sustained by national funders of research from a range of countries with industry providing secretariat support. It is among the sources that will be used to elaborate the SRIA. In that way, PAHW will link with the industry to enable a strategic approach to support innovation and to develop pan-European activities.

There was much more coordination among public research actors during FP7 and H2020 work programmes. This was linked to the setting up in 2005 of a Collaborative Working Group of SCAR (Standing Committee on Agriculture Research), dealing with animal health

⁵⁰ www.icrad.eu

⁵¹ ‘Food Quality and Safety in Europe’ FP6 project catalogue (ISBN 92-79-02693-3); A decade of EU-funded animal health research (2012; ISBN 978-92-79-21035-8; doi:10.2777/73975); a decade of EU-funded animal production research (2013; ISBN 92-79-02693-3; doi:10.2777/19235)

⁵² https://ec.europa.eu/info/sites/info/files/food-farming-fisheries/farming/documents/factsheet-agri-animals-health_en.pdf ; https://ec.europa.eu/info/sites/info/files/food-farming-fisheries/farming/documents/factsheet-agri-animal-production-systems_en.pdf

⁵³ <https://cordis.europa.eu/project/id/22515>

⁵⁴ www.discontools.eu

and welfare research (CWG AHW)⁵⁵, on the basis of which ERA-NETs arose, as well as an international network of research funders, STAR-IDAZ.

STAR-IDAZ is an international network of public research funders aiming to maximise global coordination on animal health research, supported by FP7, and followed up by an International Research Consortium (STAR-IDAZ IRC)⁵⁶. Throughout its global and regional activities, STAR-IDAZ has established a network of organisations managing research budgets or programmes, which counts around 70 countries among members and associated countries opening new avenues for global cooperation.

CWG AHW developed a Strategic Research Agenda, with the latest version in 2018⁵⁷. The CWG collaborated with the SCAR Strategic Working Group SCAR FISH, to develop a SRA on disease prevention in farmed fish⁵⁸. Comparable documents were developed on animal welfare⁵⁹.

There is a history of successful EU public-public research partnerships mainly ERA-NETs: The FP7 EMIDA⁶⁰ (animal infectious diseases), followed by ANIHWA⁶¹ (animal health and welfare), succeeded in mobilising in total over 70 million euros in 5 joint calls funded by member countries.

ICRAD ERA-NET for international coordination of research on infectious animal diseases⁶², with 28 funding partners from 14 MS, 3 ACs, plus Russia and Switzerland, started in October 2019. Its first call mobilised 20 million euros and a second call was launched in 2021. Those activities provided improved collaboration on research prioritisation and procurement for public institutions while companies were involved marginally into research projects until now. It is expected that a number of funding organisations in ICRAD will join the PAHW consortium.

Other H2020 ERA-NETs address animal welfare to a certain extent, and animal health to a limited range, as part of more general or transversal approaches i.e. SusAn on Sustainable Animal Production⁶³, and CORE Organic Co-fund on Organic Food and Farming Systems⁶⁴.

The One Health EJP co-fund project⁶⁵ under Horizon2020 is a consortium of 44 partners from 22 European countries and is composed of partners from animal health, public health and food safety research performing organisations (RPO) with reference activities. Ample experience has been acquired on preparedness, on epidemiology and cross-sector collaboration undertaken through projects performed following internal calls with provision of in kind resources by consortium members. It therefore represents a solid basis for PAHW.

The EPIZONE network on epizootic disease diagnosis and control⁶⁶ was started under FP6 as a Network of Excellence and thereafter successfully followed up by the self-sustainable

⁶⁶ <https://cordis.europa.eu/project/id/16236>

EPIZONE European Research Group⁶⁷, which is now the largest European Research Network on Epizootic animal diseases, including those that may have zoonotic potential. EPIZONE will be invited as a PAHW partner or stakeholder, in order to benefit from its expertise and activities.

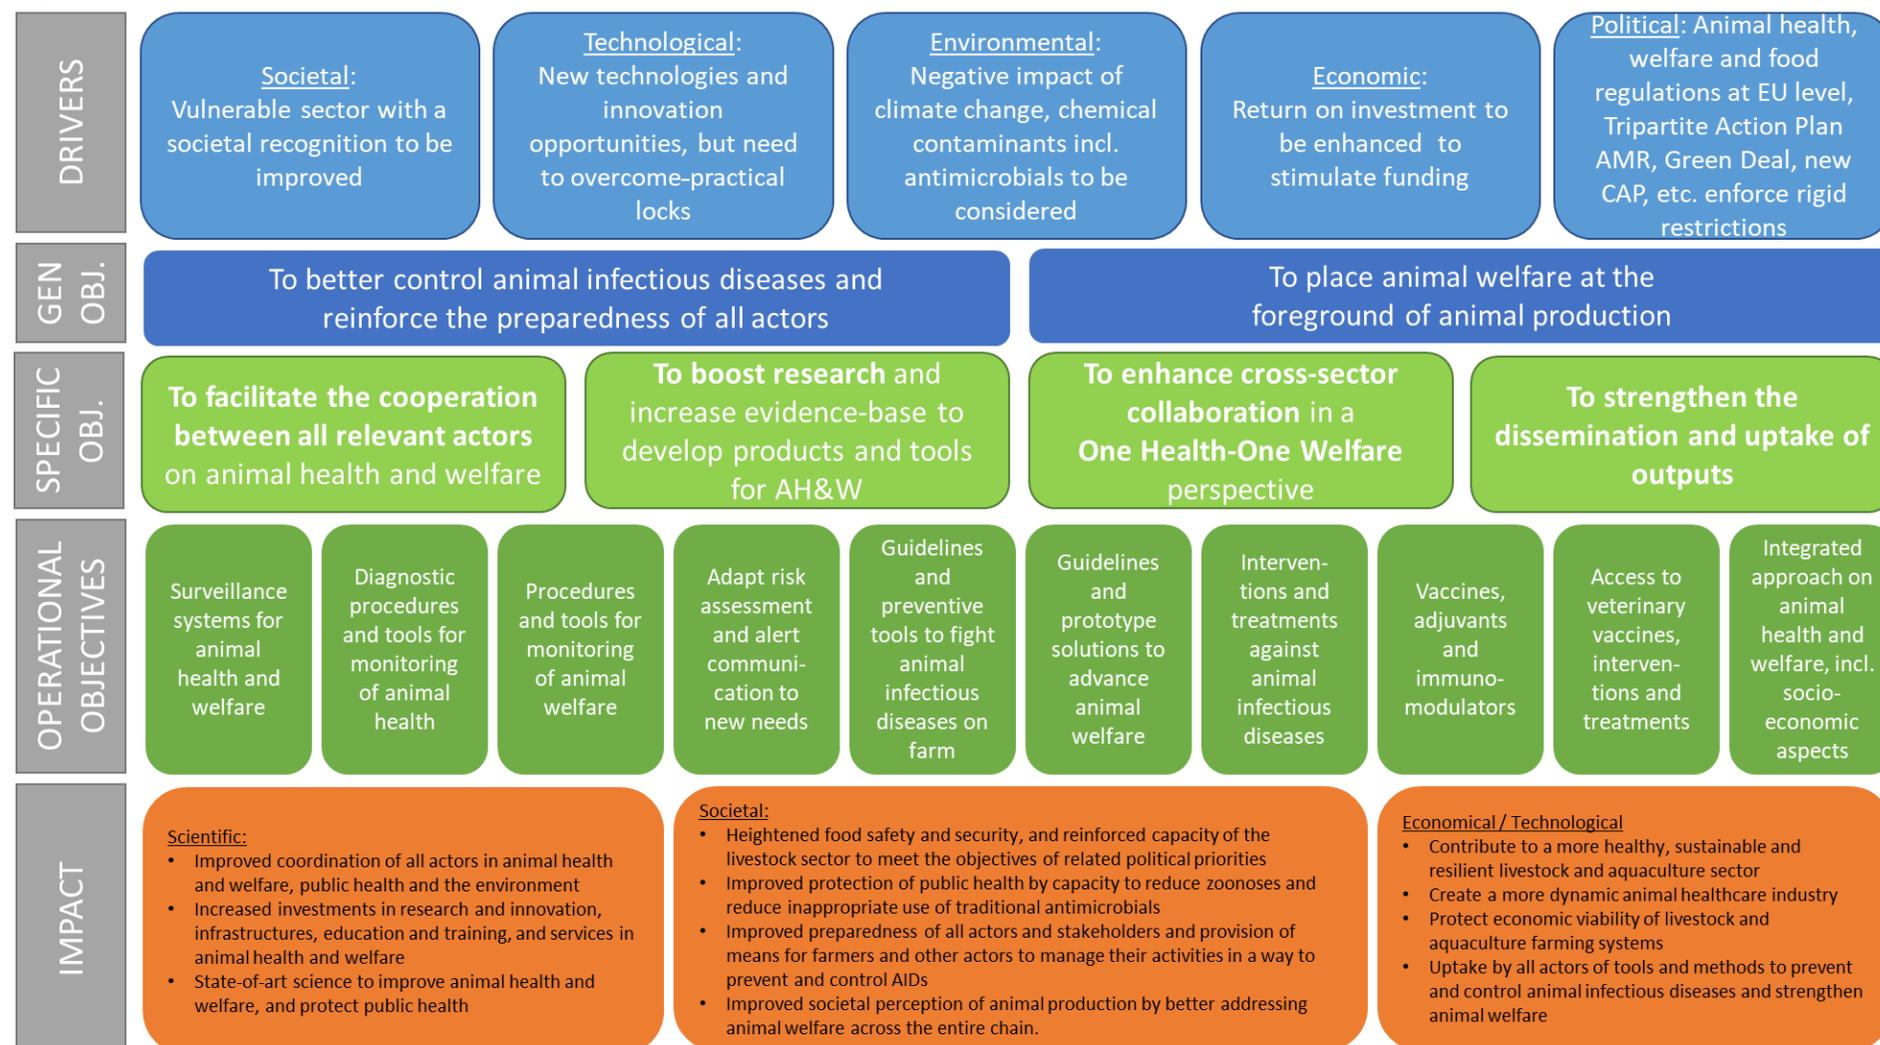

PAHW intends to build on these initiatives. The momentum exists to strengthen the level of collaboration between public entities, as well as with the private sector, but shifting gear is necessary. Notably, PAHW will mobilise a critical mass of resources; stronger collaboration with industry will ensure that research and innovation activities performed at low to high Technology Readiness Levels (TRLs) will facilitate uptake of results by industry and other users.

2.2 Common vision, objectives and expected impacts

The diagram below summarises the problems and drivers identified above (2.1 Context and problem), as well as the general, specific and operational objectives of PAHW.

⁶⁷<https://www.epizone-eu.net/>

Figure: Intervention Logic of PAHW

Both General Objectives (GO) are related to all the drivers illustrated on top of the figure. Similarly, all Specific Objectives (SO) relate to both GO, and most of the Operational Objectives can be linked to all four SO.

2.2.1 Vision, ambition and impacts

The vision of the PAHW is to provide society with reassurance on the control of infectious animal diseases with appropriate means, where antimicrobials are prudently used, and on the respect and improvement of the welfare of animals, thus contributing to sustainable animal farming and the protection of public health and the environment. This vision and ambition will be achieved through strengthened cooperation between public research and innovation entities, and the association of relevant partners, including relevant authorities, the animal health industry, other stakeholders, including animal welfare NGOs.

The ambition of PAHW is to build a strong research and innovation framework strengthening Europe's capacity to raise healthy animals and to improve welfare standards.

Further specification of key performance indicators (KPIs) for all objectives as well as the methodology for their monitoring will be done through an iterative process as part of the development of the Strategic Research and Innovation Agenda (SRIA).

By pursuing the objectives and related activities, the partnership will leverage efforts across countries, sectors and disciplines that will allow achievement of the following key **expected impacts**:

<i>Scientific impact</i>
<ul style="list-style-type: none">– Improved coordination of all actors in animal health and welfare, public health and the environment– Increased investments in research and innovation, infrastructures, education and training, and services in animal health and welfare– State-of-the-art science to improve animal health and welfare, and protect public health
<i>Societal impact</i>
<ul style="list-style-type: none">– Heightened food safety and security, and reinforced capacity of the livestock sector to meet the objectives of related political priorities– Improved protection of public health by capacity to reduce zoonoses and reduce inappropriate use of traditional antimicrobials– Improved preparedness of all actors and stakeholders and provision of means for farmers and other actors to manage their activities in a way to prevent and control AIDs– Improved societal perception of animal production by better addressing animal welfare across the entire chain.
<i>Economical / Technological impact</i>
<ul style="list-style-type: none">- Contribute to a more healthy, sustainable and resilient livestock and aquaculture sectors– Create a more dynamic animal healthcare industry– Protect economic viability of livestock and aquaculture farming systems– Uptake by all actors of tools and methods to prevent and control animal infectious diseases and strengthen animal welfare

2.2.2 General objectives

For the purpose of this partnership, **animals** mean living farmed/managed animals, whether **terrestrial or aquatic**⁶⁸, including bees, as well as companion animals and wildlife when there is a potential threat to public health or health of production animals. Causative agents responsible for animal infectious diseases (AID) include bacteria, viruses, parasites, fungi and prions. Activities related to sustainable farming and breeding are within the scope of PAHW as long as they can be directly linked to animal health or animal welfare. All production systems are considered, including for instance organic farming.

PAHW focuses on the following areas:

1. Regulated and emerging diseases (AID) for which prevention and control have an important policy dimension because of their impact on animal health, food production/safety, regional or global trade and public health.
2. Priority production and endemic AID that cause detrimental economic losses to farmers and the animal production sector, and may lead to weakened animal welfare, increased antimicrobials use and, consequently, risk to public health and health of ecosystems. Some of those diseases are often complex to control and may be notifiable in a number of countries.
3. Animal welfare, to strengthen the well-being of animals and accommodate animals' needs as well as societal and political demands and a growing interest from the market. Improved welfare and research on animal welfare will also support prevention of disease, e.g. by improved resilience of animals against AID. The 3R principle will be pursued in animal health research and product development.

The PAHW will reinforce the One Health-One Welfare principles and will reach out to authorities responsible for and scientists active in the sectors of animal health, animal welfare, public health, food safety, economic sustainability and the environment. The area of activities will include farm management, animal based (welfare) measures, livestock resilience, zoonoses, vector-borne, food-borne pathogens and emerging diseases at primary production, and issues such as AMR.

It should be noted that research relating to AMR is being defined in cooperation with and complementary to the planned EU Partnership One Health – AMR. Similarly, as regards animal welfare cooperation is planned with the EU Partnership on Agroecology.

The general objectives of PAHW are as follows:

GO1 To better control animal infectious diseases and to reinforce the preparedness of all actors

Improved animal health surveillance, more accurate diagnostics, risk assessment tools adapted to new types of data, modern farming practices including efficient biosecurity management, and new or better vaccines/treatments, will lead to less production loss, decreased use of antimicrobials and reduced AIDs with possibly less spill-over of zoonotic infections and resistant germs to humans.

Potential indicators:

- Reduced occurrence of some selected AID.
- Reduced use (sales as an estimate) of antimicrobials in livestock production and aquaculture.
- Reduced burden (e.g. economic, societal) of some selected AID.

⁶⁸ Aquatic animals include marine and freshwater fish.
Partnership_AHW_v6.4 final for RTD.G4 27,4,2022, version 27 April 2022

GO2. To place animal welfare at the foreground of animal production

Mitigating or removing animal welfare challenges addresses societal concerns, increases animal resilience to diseases that may impair productivity, and deepens the understanding of the links between animal health and welfare. Research on animal welfare will accompany the implementation and further development of the new European animal welfare legislation and contribute to increase the interest of food chain actors and consumers in improved animal welfare. Finally, a One Welfare approach will strengthen both human wellbeing and animal welfare and facilitate sustainable livestock production and aquaculture.

Potential indicators:

- An increase in available data on trends of animal welfare at farm, transport, at slaughter in the EU for policy, commercial and scientific purposes (EFSA, OIE, EU Reference Centres for Animal Welfare)
- A significant reduction or ban of inadequate husbandry systems and management practices
- A wider adoption of animal welfare labelling systems in Europe

2.2.3 Specific objectives

Based on the general objectives outlined above, the following specific objectives are proposed.

SO1. To facilitate the cooperation between all relevant actors on the monitoring, prevention and control of AID and on animal welfare issues

Offering all public and private players in the field of animal health and welfare the possibility to set up research and other kinds of integrative activities, training and education actions, and to share experience, will lead to a reinforced cooperation that will support the realisation of the general objectives of PAHW.

Potential indicators:

- Needs from stakeholders integrated in the PAHW call organisation and experimental designs (e.g. industry, regulation).
- Number of organizations taking part in joint integrative activities (common research projects, PhD, other activities, i.e. harmonization of methodologies, ring trials, simulation exercise, etc.).
- Number of new formal collaborations (MoU and alike) and shared resources/tools, including experts (e.g. AHW specialists, risk assessors, economists, social scientists, ethologists...), biobanks, sort term missions, etc. between organizations and stakeholders, common webinar or meetings to exchange information and results.

SO2. To boost research and to increase the evidence-base to develop products and tools for animal health and animal welfare monitoring and control

Joint transnational research and other research and innovation activities will create new knowledge, methodologies, techniques, procedures, data and databases, models, system designs, insights, networks and products, etc. that will be available for further uptake.

Potential indicators:

- Number of joint transnational calls organised, number of projects selected for funding.
- Number of scientific papers/communications produced by PAHW.

- Number of novel deliverables (i.e. methodologies, techniques, procedures, data and databases, models, preventive/curative/diagnostic tools, etc.) produced.

SO3. To enhance cross-sector cooperation and collaboration (One Health-One Welfare perspective)

The contribution of PAHW to a multidisciplinary approach (i.e. the design and implementation of surveillance and monitoring systems, the harmonization of tools and procedures, the design of husbandry systems and management practices, the alignment of the risk assessment, etc.) across sectors dealing with animal health and welfare, public health, food safety, farm economics and the environment regarding zoonoses, antimicrobial use and resistance and animal welfare will enable targeting actions contributing to sustain the health and welfare of animals, people and ecosystems.

Potential indicators:

- Number of initiatives that have been set up across sectors, i.e. regarding design and implementation of welfare monitoring and disease surveillance systems, laboratory methods, risk assessment, with PAHW involvement and that support public health.
- Number of cross-sector PAHW outputs, e.g. common publications on epidemiology and trends of zoonoses or AMR, on farming's effects on animal welfare and the interrelated impact on public and animal health.
- Number of contributions (e.g. reviews, studies, trials, etc.) from PAHW to wider One Health-One Welfare initiatives like Tripartite + or other.

SO4. To strengthen the dissemination and uptake of project outputs to societal, political and private stakeholders

Upstream and continuous interaction with stakeholders to identify their needs and demands, general and targeted communication on the outputs of PAHW, both dealing with animal health and animal welfare, dissemination of its deliverables to partners, national and international stakeholders, and to all other possible users, will stimulate their uptake and implementation all over Europe.

Potential indicators:

- Uptake of PAHW outputs by EU reference laboratories and EUCAW.
- Use of PAHW outputs in reports/opinions of EFSA, ECDC and EEA, in global reference bodies (e.g. OIE, FAO, WHO), in EU regulatory initiatives, EU and MS welfare labelling schemes, regarding treatments/vaccines by the European Medicines Agency (EMA).
- Uptake of PAHW outputs by livestock industry and other end users: Intellectual Property Rights/ patents/ marketing authorisations secured, filed or granted or in progress.
- Increase in the number or proportion of research projects from open calls in which an industrial partner is involved, compared to ERA-NETs (target 30%).
- Number of new procedures, endorsed in day-to-day practice in laboratories and welfare reference centres.
- Number of innovations that have been brought to a high(er) TRL (Technology Readiness Level).
- Number of leaflets, newsletters, website visits, meetings and webinars with external participants.

2.2.4 Operational objectives

The following operational objectives are defined together with proposed activities and some envisaged indicators.

OO1. To design and harmonize surveillance and monitoring systems for animal health and welfare

Action 1. Optimize and extend to other countries current surveillance systems for animal health and zoonotic infections and to develop new ones where needed.

Action 2. Set up a European wildlife network (for both terrestrial and aquatic animals), based on existing wildlife disease surveillance and reporting systems, to coordinate and expand their activities, to analyse wildlife populations in Europe, and to analyse what specific data with reference to potential threat to animals and humans are needed.

Action 3. Create networks that bring together bio-informatics and epidemiology, to harmonize metagenomic data and data collection methods, to integrate genomic, clinical and epidemiological data, applicable to both livestock/aquaculture and wildlife.

Action 4. Monitor pathogens of veterinary importance (that are not covered in One Health calls) and their antimicrobial resistance profiles.

Action 5. Build networks, develop FAIR data and implement FAIR principles for the monitoring of (re)emerging animal health and welfare issues, and to develop a hazard monitoring and early warning service.

Action 6. Create a platform on animal welfare in the EU with the objective to provide scientific and technical support to all stakeholders, in particular related to data necessary for the monitoring of animal welfare; develop animal welfare surveillance systems and their evaluation.

Potential indicators:

- Number and extent of networks and reports related to surveillance of health and monitoring of welfare in livestock and aquaculture and wildlife.
- Number of guidelines concerning genomic surveillance of AIDs or AMR in animal pathogens (that are not covered by other calls).
- Number of pilot studies on novel or improved methods and tools for surveillance and/or participants in those studies.

OO2. To develop diagnostic procedures, methodologies and tools to support the monitoring of animal health

Action 1. Gain knowledge on priority pathogens (i.e. bacteria, parasites, viruses, fungi, prions, including resistance patterns) responsible for important economic losses or high risk of transmission to humans, and their detection methods, including metagenomics approaches, molecular markers of interest, etc.

Action 2. Development, optimisation and standardisation of reliable, faster, potentially automatable and/or scalable direct antigen/genome amplification/detection and indirect detection/immune response assessment tools/technologies; tools for the rapid detection of drug-resistant bacteria, viruses, fungi or parasites; on-farm, pen-site diagnostics for pathogens and antimicrobial resistance; focus on priority pathogens and those that do not have EURL.

Action 3. Development, optimisation and standardisation of tools to distinguish between (i) infected and vaccinated individuals (DIVA) as well as (ii) dead and infectious pathogens for

the study of pathogens' survival in the environment or in effluents and (iii) to study inter-species (including wild animals) circulation of pathogens or resistant variants.

Action 4. Development of quantitative and multi-target diagnostics to identify infection levels and microorganisms that can interfere with animal production, for informed treatment/prevention measures decisions in enzootic diseases in animals.

Action 5. Development of non or less invasive and more convenient sample collection methods, including new matrices as well as transport, storage, treatment strategies and corresponding diagnostic tools, also suitable for the detection of diseases in free-ranging or wild animals.

Action 6. Application of new methodologies, i.e. research focusing on application of new detection and characterisation methodologies, on in vitro models; study host-pathogen-environment interactions, i.e. focusing on drivers and markers, on characterisation of microbial ecosystems, on drivers of pathogenicity or resistance.

Potential indicators:

- Number of scientific publications (general, across pathogen-types, across animal species, considering AH & AW integration, considering One Health).
- Number of new markers for e.g. host response/vaccine efficacy, drug resistance/efficacy, variants, zoonotic potential, infectivity/virulence, etc.
- Number of new diagnostic procedures, validated and harmonized.
- Number of new reagents developed, optimised, automatized and/or harmonised.
- Number of new biobanks, stocks of reference materials, models etc. to be shared with other partners.

OO3. To develop procedures, methodologies and tools to support the monitoring of animal welfare

Action 1. Focus on positive welfare (positive emotions), identification of behavioural, endocrine and neurological indicators of positive welfare: research focusing on animal cognition, preferences and motivation to obtain rewards.

Action 2. Development of technologies on the slaughter line to assess animal welfare (on farm and/or during transport). Identification of suitable animal-based measures (ABM) with appropriate level of validity, sensitivity and specificity; development of in-line sensors, large scale data collection.

Action 3. Animal welfare at slaughter: i) consciousness and death: development of technologies, procedures and/or protocols to increase the reliability of methods to assess consciousness and death at the slaughter line; ii) improve stunning and killing methods; iii) work on design of slaughter facilities in order to avoid welfare issues like stress, fear and pain at pre-slaughter phase; related staff training.

Action 4. Development of physiological indicators to measure acute and chronic negative animal welfare consequences on farm. The indicators should identify stress, pain, fear, discomfort, etc. at individual and group levels: measure of physiological stress, impact on immune response and omics (e.g. transcriptomics and metabolomics). Integration of these to metadata welfare tools.

Action 5. Development of digitally assisted monitoring technologies on farms for increasingly enabling precision management of animal (health and) welfare. Technology includes recording visual and auditory signals related to animal-based measures for welfare,

analysing records with deep learning technology, data processing techniques and decision support systems.

Action 6. Development of technologies to assess animal welfare during transport. Affordable and reliable solutions to prevent serious welfare problems through early detection of signals before and whilst in transit, e.g. lameness, lesions, heat stress, aggression, thirst or hunger, exhaustion, etc. Development of sensor technology, data analysis tools, data collection and integration platforms, decision support for the driver; related staff training.

Potential indicators:

- Number of scientific publications on the assessment of welfare on farm, during transport and at slaughtering.
- Number of new welfare indicators and markers endorsed by the animal welfare community.
- New guidelines and tools, e.g. for welfare diagnosis, for monitoring positive animal feelings, etc.

OO4. To adapt risk assessment and alert communication to the new needs in animal health and welfare

Action 1. Enhance rapid risk and consequence assessment methodologies, to assess the economic, social, environmental and cross sectoral consequences of animal health and welfare issues.

Action 2. Study and assess epidemiological associations between human interventions such as hunting, trade, transport, rewilding and translocations of wildlife and disease spread, in order to propose harmonized tools to support alert systems.

Action 3. Adapt existing, or develop new methodologies to integrate genomic surveillance data in risk assessment and to draft risk assessment guidelines for the integrated use of epidemiological and genomic data.

Action 4. Assess the risk of spread of resistant animal pathogen clones and genes encoding resistance.

Action 5. Build or further map and coordinate emergency networks for scientists and communities, to increase risk knowledge by systematically collecting data and undertaking risk assessments (availability of risk maps and data, knowledge on hazards and vulnerabilities).

Action 6. Develop animal welfare surveillance and its evaluation, develop indicators and alarm levels, produce factsheets and any relevant digital infrastructure that enable risk assessment of any breach in animal welfare.

Potential indicators:

- Number of existing networks, methods, tools, data and protocols mapped, described and analysed.
- Number of new assessment guidelines and models.
- Number of dashboards with integrated data and functionalities for real time management implemented.

OO5. To develop guidelines and preventive tools to fight against animal infectious diseases on farm and during transport

Action 1. Establish a multidisciplinary network of experts with focus on biosecurity measures to prevent and control AID on farm and during transport, and draft foresight and priority studies on animal health, public health, pandemics and the role of biodiversity, the changing climate, emerging vectors and vector-borne diseases, bird and fish migrations, epidemiology/ modelling, bioinformatics, etc. for all animal species, including minority species and aquaculture.

Action 2. Reduce the entrance and spread of AID by reinforcing external and internal biosecurity in both terrestrial and aquatic animals, while limiting antimicrobial use, set up innovative systems and models with focus on biosecurity and integrated management.

Action 3. Perform research on prudent use of antimicrobials: research on treatment concepts for antimicrobial and antiparasitic usage, on alternatives to antimicrobials including feed additives/nutrition, studying improved vaccination strategies, etc.; development of best practices for administration/application of Veterinary Medicine Products (VMP) in livestock and aquaculture production systems.

Action 4. Reinforce animal resilience/resistance (the natural ability of animals to withstand pathogens), through feeding and breeding; establish a pan-European network of experts in genetics (breeding), feed additives including pre- and probiotics and leading experts in immunology to produce foresight and priority reports; both fundamental and applied research supporting animal resilience will be set up.

Action 5. Evaluate the need and possibility to set up a pan-European network of experimental farms.

Potential indicators:

- Foresight reports
- Number of guidelines on biosecurity measures
- Number of research projects on animal resilience
- Number of new concepts / knowledge produced by PAHW and endorsed by breeding companies.
- Number of experimental farms being active part of the network (to be discussed)

OO6. To develop guidelines and prototype solutions that advance animal welfare on farm, during transport and at the end of life

Action 1. Establish a multidisciplinary network of experts to draft foresight and priority studies with focus on sustainability aspects related to non-cage systems, indoor and outdoor systems for livestock, animal transportation and slaughter, killing on farm, in slaughterhouses or at sea, and focussing on ending mutilations, including aquaculture production systems.

Action 2. Perform research on how to improve animal welfare while maintaining or increasing farm economic and environmental sustainability. Involves animal cognitive capacities and emotions adapted to each species' needs, opportunities for pain relief, and environmental enrichments technologies. Aims to develop innovative housing systems and addresses the opportunities and consequences of reducing the use of cages in a sustainable way, in terms of economic and environmental impacts.

Action 3. Perform background science to identify indicators and to develop systems to assess the state of consciousness and death, develop appropriate Precision Livestock/fish Farming

and killing technologies to limit pain and reduce stress, alert systems for poor welfare during transport, etc.; develop innovative systems in livestock/fish transport and slaughter.

Action 4. Improve animal welfare through feeding and breeding strategies.

Action 5. Evaluate the need and possibility to set up a pan-European network of experimental farms.

Potential indicators:

- Foresight reports
- Number of on management- and resources-based indicators for animal welfare.
- Number of new welfare technologies on farm, during transport and at slaughter.
- Number of welfare technologies brought to higher TRL levels.
- Number of experimental farms being active part of the network (to be discussed)

OO7. To develop new interventions and treatments, or improve existing ones, against specific priority animal infectious disease

Action 1. Perform basic research (TRL 1-2) to study interactions between pathogens and host microbiome, focussing on the immune system (e.g. pathobiome), and direct or indirect interactions between pathogens (e.g. co-infections), antimicrobial and antiparasitic drugs and host microbiome, mechanisms of anti-microbial (antibiotic and antiparasitic) resistance; trained immunity.

Action 2. Develop tools such as (i) experimental farm approaches; (ii) in vivo, in vitro and in silico infection models for testing efficacy and safety of new drugs with reduced need for animal testing, new drug-delivery devices, therapeutics including leads for new antimicrobials; and (iii) bioinformatic pipelines for analysis of microbiome and pathogen data; this will be done in collaboration with industry, where appropriate.

Action 3. Build on the results of Action 1&2 to develop or improve interventions and treatments and deliver first proof of concept, where appropriate, in collaboration with industry: demonstration of immunogenicity and efficacy (minimum immunizing dose) in target species; representative (small scale) animal (challenge) model (TRL 3-4)

Action 4. In collaboration with industry: bring outputs to higher TRL in early/pre-clinical development (GMP-material; TRL 5-6); (i) for non-food animals: demonstration of efficacy and field safety at large scale in representative animal models or approved alternative methods; (ii) for food animals: lab-scale assessment of animal safety and initiation of environmental safety, user safety, and (if needed) microbiological safety assessments; absence of toxicity/side effects; carcinogenicity studies initiated if needed, and demonstration of efficacy and field safety at large scale in a representative animal model and toxicology studies. Work on TRL 7 to 9 (late/clinical development, marketing authorisation and lifecycle management) will be performed by industry itself.

Potential indicators:

- Number of evidence based treatment schedules.
- Number of novel drugs, immune-modulators, alternatives to antimicrobials.
- Number of devices for individual and group treatment of animals.
- New tools such as improved (and standardized) assays for assessing efficacy and safety of drugs.

OO8. To develop new vaccines or improve existing vaccines, including adjuvants and immune-modulators

Action 1. Study the role of the immune system of farm animals, including the innate immune capacity of new-born animals and using high-end technologies (e.g. transcriptomics/single-cell sequencing); the mechanisms that elicit protective immunity at the entry site, factors affecting immune response to vaccines, mode of action of adjuvants (basic research; TRL 1-2).

Action 2. Develop tools such as vaccine platforms and expression systems, immunological toolboxes (cell lines, reagents, etc.) and delivery systems, etc.; this will be done in collaboration with industry, where appropriate

Action 3. Build on the results of Action 1&2 to develop or improve vaccines and immune-modulators and deliver proof of concept: demonstration of immunogenicity and efficacy (minimum immunizing dose) in target species; representative (small scale) animal (challenge) model (TRL 3-4) or approved alternative methods; this will be done in collaboration with industry, where appropriate.

Action 4. In collaboration with industry: bring outputs to higher TRL in early/pre-clinical development (GMP-material; TRL 5-6); (i) demonstration of animal safety in target and non-target species; and (ii) demonstration of efficacy in a representative and validated target animal challenge model. Work on TRL 7 to 9 (late/clinical development, marketing authorisation and lifecycle management) will be performed by industry itself.

Potential indicators:

- Number of models, immunological and computational tools.
- Number of potency tests to evaluate efficacy of vaccines (3Rs).
- Number of new pilot vaccines and adjuvants developed.
- Number of vaccine platforms, platforms for antigen discovery, production and delivery.
- Number of new or improved delivery systems.
- Number of new immune-modulators developed

OO9. To increase access to veterinary vaccines, interventions and treatments and uptake of said vaccine interventions and treatments in the field

Action 1. Monitor the results of the PAHW projects and evaluate if they can be the basis of new patent applications.

Action 2. Manage intellectual property (IP) and further development of the deliverables towards European Innovation Council (EIC) or similar programmes and industrial partners.

Action 3. Prepare the regulatory process for novel and innovative vaccines and treatments developed by the PAHW, with implementation of regulatory experts (for each of the projects in the implementation phase), interaction with national regulators and with EMA, taking into account its recently published paper (Regulatory Science Research Needs⁶⁹).

Action 4. Develop methods and procedures for comparative evaluation of clinical efficacy of veterinary antimicrobials to feed into antimicrobial guidelines and policies.

Potential indicators:

- Number of recommendations on regulatory aspects for each vaccine/treatment-lead.

⁶⁹ https://www.ema.europa.eu/en/documents/other/regulatory-science-research-needs_en.pdf

- Number of business plans for new vaccine/treatment-leads that will be successful at the end of the implementation phase.
- Procedures for comparative evaluation of clinical efficacy of veterinary antimicrobials.
- Guidelines for registration of alternatives to antibiotics

OO10. To develop an integrated approach on animal health and welfare including socio-economic aspects of animal health and animal welfare

Action 1. Assess the burden of selected priority diseases (including resistant pathogens), including their control (e.g. cost-benefit of different surveillance components and risk mitigation options).

Action 2. Set up social science studies among farmers, consumers and other actors along the production chain on their behaviour (also in relation to AM use) to maintain and improve animal health, including consumers' willingness to pay for improvements; incentives and barriers to adopt innovations and practices.

Action 3. Set up social science studies among farmers, consumers and other actors along the production chain on their behaviour to maintain and improve animal welfare, including consumers' willingness to pay for improvements; incentives and barriers to adopt innovations and practices, including welfare labelling schemes.

Action 4. Study the integration of AID mitigation and improved animal welfare in the overall context of sustainable livestock production and aquaculture in the EU.

Action 5. Develop integrated strategies for the control of diseases, including emergency situations, taking into account relevant criteria, e.g. epidemiological situation, cost-benefit, etc. in order to support decision making by national and international risk managers and other relevant stakeholders.

Potential indicators:

- Number of scientific publications on socio-economic studies related to health and welfare
- Number of new animal welfare labelling schemes initiated by MS and / or industry
- Number of policy briefs on intervention strategies

2.2.5 Amount of R&I investments needed to achieve impacts

A first estimation of R&I investments has been done in line with the objectives and proposed activities. Considering the breadth of the scope of PAHW, prioritisation will need to be made through continuing consultation of potential partners as well as stakeholders. Such a consultation has been done for drafting the dossier during dedicated webinars and is planned for the SRIA that will be developed in the course of 2022 as well as for its continuous update.

Activities will need to match the budget available to PAHW, both for animal health and for animal welfare, as well as for terrestrial and aquatic animals. Therefore, while this section provides indications on budget needed, it will be completed once the resources and budgets made available by partners to PAHW are known.

In order to achieve optimal integration of public research actors (RPO like research centres, reference laboratories and reference centres) supported by funding organisations (FO), and thus generate essential new knowledge that supports innovation in the fields of PAHW (support of livestock and aquaculture, public health and animal welfare), the budget should be a significant proportion of national expenditures (MSs spend circa €300-€400

million/year). Mobilisation of resources will depend on whether resources and programmes are redirected and aligned within activities of RPO members of the PAHW consortium (internal activities including research calls mostly with in kind contribution), and/or whether research activities are performed mainly through external calls requiring ‘in cash’ funds from FO.

The contribution from the private sector (industry) will depend on the number of FO that can fund industry and on industry’s commitment to participate to the PAHW with their expertise and in kind contribution. For instance, the animal health pharmaceutical industry spends circa €500 million/year in R&D including for pet animals, i.e. 7.8% of their turnover⁷⁰ (livestock including birds represent around 50% of the turnover).

The animal health industry or other relevant sectors (e.g. feed industry) will not be member of PAHW consortium, but can contribute (i) as member of the stakeholder committee and/or the scientific advisory board to discuss the industry’s needs and/or to evaluate the market potential of technologies in projects; and (ii) through in kind contributions in R&I projects selected through external calls, in particular for those projects at TRL 4 or above (early/pre-clinical to late/clinical development).

On **surveillance**, the various activities considered on animal health and welfare amount to around €80 million, with a balanced share between the 6 themes proposed: livestock health surveillance, wildlife health surveillance, genomic surveillance, AMR surveillance, horizon scanning using FAIR data, and welfare surveillance.

Estimation of work related to support to **monitoring of animal health, including diagnostics, and of animal welfare**, as well as on risk assessment, is not easy to estimate. It will be a domain where significant, possibly expensive, basic research will be needed, to support epidemiology, diagnostic, treatments and vaccine development and uptake. It will depend largely on the diversity of pathogens targeted. €100 million would enable to undertake substantial research.

On **farming practices**, the various activities considered amount to around €60 million, with a balanced share between the 5 themes proposed: preventive tools (other than treatments/vaccines) to fight AID, reduction of AMR (e.g. biosecurity), increasing resilience (e.g. through breeding), prototype solutions to advance animal welfare, respectively ‘on farm’ and ‘during transport and at the end of life’.

According to figures from business intelligence, development cost of **veterinary vaccines** is on average in the area of 10-20 million euros⁷¹ (up to TRL 9). This is much less than in the medical domain, where cost was estimated to be around USD 100 million in a study on several infectious diseases for research up to phase 2a assuming no risk of failures⁷². Accounting for probability of success, costs can go up to USD 400 million. Development tracks for veterinary vaccines are shorter (no preclinical research in animal models but directly in target species), less costly and de-risked at an earlier stage of development when compared to human vaccines. It is unlikely that the partnership can bring products beyond TRL6-7, but according to experts involved in the preparation of PAHW, an investment of e.g. €100 million could potentially end up in around 25 implementation outputs (TRL 5-7) with 80% probability of success in next stage, out of 200 initial Proof of Concept studies.

The above considerations lead to a very rough estimation of €340 million, as a minimum, to perform the planned research activities, to which **management** costs and certain **other activities** (education and training, communication, etc.) need to be added, meaning at least an

⁷⁰ <https://www.animalhealthurope.eu/resources/124:facts-figures-2020.html>

⁷¹ [GlobalBenchmarkingSurvey2015_EuropeReport14Jan2016noappendices 1.pdf](https://www.globalbenchmarkingsurvey.com/GBS/2015/EuropeReport14Jan2016noappendices1.pdf)

⁷² [http://dx.doi.org/10.1016/S2214-109X\(18\)30346-2](http://dx.doi.org/10.1016/S2214-109X(18)30346-2)

extra 60 million. The total amount of R&I investments necessary to reach the objectives would be €400 million as a minimum.

Main types of activities and estimated budget

Type of activity	Total amount (€)
Research activities	340M
– Surveillance (AHW)	≠ 80M
– Monitoring (AHW) risk assessment	≠100M
– Farming practices	≠ 60M
– Vaccines and treatments	≠100M
Management and other activities (see 3.1)	60M
Total	400M

It is expected that the main part of the activities will be devoted to research activities, performed both internally (research projects and integrative activities) and through external calls. Networking and studies would be the second main part of costs, followed by training, capacity building, sharing of equipment, infrastructure and data, communication and management.

It should however be highlighted that these are rough estimates at the moment of writing the present document and that they will need to be refined during the partnership preparation and implementation and once the total financial and in-kind commitments available for this partnership will be known. The ratio between in cash and in kind will depend on the respective contributions of the countries.

2.2.6 Relevant transformational changes

Use of antimicrobials and protection of animal welfare are among concerns raised by citizens as regards livestock production and aquaculture, next to the safety of food. More recently with COVID-19, the risk of diseases transmitted from animals has further increased in importance. PAHW will address these concerns, directly or indirectly. Indeed, the vision of PAHW is a society reassured on the control of infectious animal diseases with appropriate means, where antimicrobials are prudently used, where animal welfare is respected and improved, thus contributing to sustainable animal farming and the protection of public health, also through the safeguarding of antimicrobial efficacy.

Providing knowledge, guidelines and tools on appropriate welfare measures across the entire chain (i.e. on farms, during transport and in slaughterhouses) is expected to address societal concerns raised in e.g. the Citizens Initiative ‘End the Cage Age’. It will facilitate an improvement of the wellbeing of terrestrial and aquatic species kept for farming purposes and create a life worth living for millions of animals. A high standard of welfare will also help to securing good productivity and promoting increased resilience to avoid disease and infections. This will likely lead to an increased share of high welfare products in food stores and facilitate compliance of animal owners. In addition, innovative animal-free models will reduce the need for animal testing in the development process of new medicines, thus responding to another societal pressure relating to animal welfare.

An efficient R&I coordination between animal health, animal welfare, public health and the environment (One Health-One Welfare approach) will enhance timely exchange of information and common action. It will build trust among partners across policy domains or disciplines and shorten time of reaction and commitment to common investments in cross-

sector methodologies (procedures, databases, management structures, new husbandry systems, etc.).

The authorities (ministries responsible for agriculture/fishery, environment, public health, economy) and the society will profit from the outcomes of PAHW. For instance, sensitive surveillance systems, and related laboratory techniques and databases, practices (including biosecurity), treatments and vaccines as alternatives to the use of antimicrobials, simulation exercises, reliable high welfare labelling of products, etc. all lead to improved health, reduced loss of production and increased consumer confidence.

Project outputs and outcomes will serve to build further research on, thus having an impact on research and technology. Furthermore, strategic collaboration with the private sector is envisaged and will be a new and key feature to better complement public research efforts, in ensuring that joint projects are performed and mutual goals are attained. In addition, project outcomes can be taken up by the industry for further development at later TRL (registration (TRL 8) and lifecycle management (TRL 9)). Examples are development and innovation efforts in different domains such as diagnostic tools, vaccines, therapeutics, alternatives to antimicrobials and new welfare marketing concepts, which will represent an economic impact of the Partnership. Elaborate procedures regarding the creation and utilisation of foreground will guarantee a fair sharing of investments and economic benefits reaped by partners from the outcome.

2.2.7 Exit-strategy and measures for phasing-out from the Framework Programme funding

The Partnership will create a strong public-public and public-private cooperation framework consisting of the main actors in the participating MS/AC (and potentially third countries) involved in animal health and welfare. Since not only RPO (public reference laboratories and reference centres, and research organizations), but also FO, authorities and industry will take part in PAHW, the uptake of the results into the normal tasks of these actors will be ensured. For instance, new and improved surveillance and monitoring systems will be introduced, more sensitive and specific laboratory procedures and animal-based measures will become available, new risk assessment models and methodologies would be utilised, etc. The expected impact of PAHW illustrates that some of the activities will be stopped, some may be extended and new ones proposed. In addition, PAHW activities will fill only certain priority gaps and new shortages and needs for applied or basic research in the domain will be identified.

During and at the end of PAHW, an assessment will be undertaken of which themes, activities, domains etc. need further EU support to bring added value, of what can be self-sustained (some models, tools etc.) or can be taken on by stakeholders, including the industry, agencies, or authorities.

Depending on the achievements, on the breadth of the identified further needs, on the success of the cooperation among the public research actors and with the private sector, on their interest and eventual commitment to move further ahead or not, various options can be considered as exit strategy:

- As a minimum, some lasting outputs of PAHW will be self-sustained or be taken up by stakeholders. Moreover, certain additional needs could be addressed by:
 - usual topics in the EU Framework Programme and/or,
 - country funding organisations deciding to organise joint calls for transnational research activities outside the EU Framework Programme;
- PAHW could be the foundation for a stronger public-public partnership;

- PAHW could be the foundation for a public-private partnership in animal health and welfare research.

2.2.8 Description of the planned process for developing a Strategic Research and Innovation Agenda/roadmap

PAHW will be backed by a Strategic Research and Innovation Agenda (SRIA) based on a clear intervention logic that links the objectives of the Partnership with the expected deliverables, expected outcomes and impact. It will include a prioritisation process and cross cutting aspects and provide a framework for the thematic priorities and the type of R&I actions needed. It will encompass enough flexibility to be adapted to evolving priorities or new needs.

It should be noted that the SRIA will be a framework of agreed intermediate level ideas for thematic partnership priorities, on which the development of annual work plans will be based. The SRIA will also provide an overview of horizontal activities (e.g. communication) and specific research activities requiring joint calls.

The development of the SRIA has not started from a clean sheet. Indeed, networks and initiatives that will potentially be partners/actors or stakeholders of the PAHW have developed SRAs or similar documents (see section 2.4 “Partner composition”). In autumn 2021, arrangements have been made that the PAHW SRIA is being drafted in close collaboration with representatives of ERA-NET International Coordination of Research on Infectious Animal Diseases (ICRAD), with input from at least CWG AHW, SCAR FISH, STAR-IDAZ IRC, DISCONTTOOLS, EPIZONE and One Health EJP. In addition, relevant international (e.g. ECDC, EFSA, OIE, EMA), national and regional stakeholders, relevant authorities and private sector organisations (e.g. AnimalhealthEurope, European Aquaculture Technology Platform; FABRE TP) will be consulted as well, to prioritize their needs and to obtain input from a broad range of experts in the field of animal health and welfare. This is also relevant for AMR topics and activities (see Tripartite FAO, OIE and WHO).

The process of assessing the existing and relevant SRIA takes place in parallel with the finalisation of the PAHW dossier. In autumn 2021, the working groups on surveillance, diagnostics, farm practices and treatment & vaccines, have been developing the intervention logic for the operational objectives, based on a first broad consultation of candidate stakeholders and authorities in June 2021 and a subsequent online survey. This output has been the basis of the present PAHW dossier and will further feed into the PAHW SRIA as well. A second consultation of country representatives and stakeholders, as well as the CWG AHW was done in December 2021.

It is planned that in early spring 2022 an advanced draft of the SRIA PAHW will be available. It will be further developed in co-creation with possible actors, stakeholders and the Commission. A broad, open consultation of the SRIA will be set up in the third quarter of 2022.

During the lifespan of PAHW, the SRIA will be revised through open consultation of actors and stakeholders, including related Partnerships.

2.3 Necessity for a European Partnership

A pan-European **alignment and integration of national public research programmes regarding animal health and welfare** is foreseen, so the form proposed for PAHW is a co-funded partnership with significant in-kind contributions from RPO, i.e. research centres and reference laboratories for animal health and reference centres for animal welfare. The Partnership will encourage cooperation and synergies among its partners, thus avoiding

duplication, and will leverage resources to support improvement of animal health and welfare.

It is the ambition of the Partnership to reach out to all appropriate national and international RPO to collaborate broadly with FO, national authorities and with the industry (animal sector, diagnostics, and pharmaceuticals). Research, innovation and other activities will be set up in cooperation with major international and national stakeholders (e.g. ECDC, EFSA, OIE and EMA) and other interested parties, so as to guarantee successful science to policy transfer with efficient leveraging effect.

2.3.1 Why we need a Partnership on animal health and welfare

Directionality

Based on the challenges, R&I gaps and opportunities as described before (2.1.2 ‘The main drivers’ and 2.1.3 ‘Main research, development and innovation needs’) PAHW will strive to better manage AID, to place animal welfare at the foreground of animal production, and to set up research projects to deliver on developments and innovations in animal health and welfare and to reinforce the preparedness of all actors. Whereas at the moment, there is no cooperation of RPO, FO or authorities to align their research programmes regarding animal health and welfare, the PAHW will commit itself to bring all relevant partners in Europe together to align forces.

No single European country has the capacity on its own to address all the R&I challenges to generate the required knowledge and innovations to ensure surveillance of known and unknown hazards, to set up detection and monitoring systems, to improve or develop new alert systems, and to standardise and validate necessary tools for automated welfare assessment, diagnostics and vaccines in the diverse livestock sectors. When billions can be mobilised quickly for a vaccine against COVID-19, only millions are mobilised for a vaccine against a deadly animal disease such as African swine fever. There is substantial duplication of work among countries, especially in the domains addressing needs by risk managers due to regulatory requirements or particular health situations e.g. emerging risks. The intended integrative activities in PAHW will reduce useless repetition of research, bring added value (e.g. harmonisation) and contribute to better preparedness of AHW actors. A significant part of these activities will be performed between RPO members of the PAHW consortium.

In most domains of PAHW, there is an increased need for data management, not least for disease surveillance, welfare monitoring and related risk assessment activities. PAHW is expected to play a key role in this domain at least for priority diseases (to be defined), ensuring a broad geographical coverage that could certainly not be achieved without PAHW. To this end, pan-European platforms will likely be established.

Additionality

PAHW aims to mobilise a critical mass of resources and leverage public research funding to counter animal health and welfare issues in an aligned and coordinated manner.

There is sometimes insufficient interest or investments by industry in certain domains, or lack of uptake of research outputs by private sector. In PAHW, the strategic and operational interaction with the industry as advising stakeholder, the continuum of research from low to high Technology Readiness Levels and the design of research topics targeted to industry will lead to an improved participation of the industry in projects and a better uptake of research outputs. It is expected that in kind resources will be brought by the private sector in the projects launched through open calls. The international cooperation could potentially bring in additional actors and resources.

2.3.2 How the partnership will address the objectives of Horizon Europe, political priorities of the EU and its Member States, and global challenges

The general objectives of PAHW are to better control animal infectious diseases and to reinforce the preparedness of all actors, and to place animal welfare at the foreground of animal production. PAHW will notably contribute to reducing production losses, decreased use of antimicrobials and reduced AIDs with possibly less spill-over of zoonotic infections and resistant germs to humans. It will also facilitate a European level playing field with respect to improved animal welfare, as well as commercially relevant opportunities for labelling of products based on validated and readily available data. This will strengthen both human wellbeing and animal welfare and facilitate sustainable livestock production and aquaculture.

The objectives of PAHW are well aligned with the provisions of Horizon Europe, Cluster 6, Intervention Area 3, whose broad lines advise that issues be addressed as follows:

- Control of contagious and zoonotic animal diseases and animal welfare.
- Prevention strategies, control measures, diagnostic and alternatives to the use of antibiotics and other substances/techniques also to tackle AMR.
- AMR and threats from biological hazards.
- Tackling the links between plant, animal, ecosystems and public health from One-Health-One Welfare and Sustainable Development Goals/Global-Health perspectives.
- Fostering international partnerships for sustainable agriculture for food and nutrition security.

The objectives highlighted above fit well with important initiatives and policies of the European Commission/Union:

- The Green Deal of the European Commission, notably the Farm to Fork Strategy for a fair, healthy and environmentally-friendly food system, was adopted in 2020⁷³. As part of it, The Commission committed to take action to reduce overall EU sales of antimicrobials for farmed animals and in aquaculture by 50% by 2030. The Commission also committed to revise the animal welfare legislation, including on animal transport and the slaughter of animals, to align it with the latest scientific evidence, broaden its scope, make it easier to enforce and ultimately ensure a higher level of animal welfare.
- As part of the Farm to Fork strategy, an Action Plan on the development of organic production was published early in 2021⁷⁴. It will help to reach the objective of at least 25% of the EU's agricultural land under organic farming by 2030. Animal welfare will play an important role in livestock and fish organic production.
- The new CAP. The Communication on the Future of Food and Farming⁷⁵ referred to “responding to societal expectations regarding food, in particular concerning food safety” ... “CAP should become more apt at addressing critical health issues such as those related to antimicrobial resistance (AMR) ... in line with an ambitious and encompassing approach with regard to human and animal health - as embodied by the "One Health" concept”. “Identically the CAP can help farmers to improve the application of EU rules on animal welfare and to further increase standards through voluntary initiatives aimed at promoting the market value of animal welfare both

⁷³ COM(2020) 381 final

⁷⁴ COM(2021) 141 final

⁷⁵ COM(2017) 713 final

within and outside the EU.” The Farm to Fork Strategy recognises the role of the CAP in supporting the transition to sustainable food systems. In the context of and subject to the ongoing legislative procedure regarding the CAP, a new system is envisaged from 2023 whereby Member States will be able to use ‘eco-schemes’ to support a transition to better animal welfare⁷⁶.

- In its communication on the European Citizens’ Initiative (ECI) ‘End the Cage Age’, the Commission set out plans for a legislative proposal to prohibit cages for a number of farm animals. The proposal will come as part of the ongoing revision of the animal welfare legislation. The Communication stated that Horizon Europe would help provide decision-makers and actors with additional scientific evidence, not least with the creation of a European Partnership on Animal Health and Welfare to be proposed for the 2023-2024 work programme.
- Replacement, reduction and refinement (3Rs) of animal testing is a long-standing objective of the European Directorate for the Quality of Medicines and Healthcare (EDQM)⁷⁷. Needs for transition to reduced animal use in medicine development are increasing. On 16 September 2021, the European Parliament has adopted a resolution on plans and actions to accelerate the transition to innovation without the use of animals in research, regulatory testing and education⁷⁸. In addition, there is the ongoing European Citizens Initiative on a Europe without animal testing, which will likely require new initiatives in this field⁷⁹.
- AMR is subject to an EU AMR action plan⁸⁰, with one pillar on research highlighting needs notably in the animal production sector. A number of the PAHW operational objectives mentioned above are addressing these needs.
- Regarding the contribution of animal health to the preparedness of countries against cross-border and cross-sector infectious threats to humans, PAHW will seek to cooperate as appropriate in the EU4Health programme and the European Health Emergency preparedness and Response Authority (HERA)⁸¹.

More globally, because AID do not respect frontiers and threaten the lives of animals, compromising their welfare, engender significant food loss, endanger the integrity and diversity of ecosystems, jeopardise the livelihood of farmers and the socio-economy of regions and nations, cost billions of Euros for control and mitigation and place human lives at risk, improving animal health and welfare as planned by PAHW will have both direct and indirect impacts on the main cornerstones of Sustainable Development, as well as on most, if not all, of its 17 goals but notably on the following ones:

⁷⁶ The list of potential agricultural practices that eco-schemes could support is available at https://ec.europa.eu/info/sites/info/files/food-farming-fisheries/key_policies/documents/factsheet-agripractices-under-ecoscheme_en.pdf

⁸¹ COM (2021) 576 Final

Figure: Major Sustainable Development Goals in relation to PAHW

Since the challenges described above are not restricted to the European continent, networking with international projects and initiatives will be sought and international cooperation developed as much as possible. Interaction with international stakeholders such as OIE, FAO, WHO and UNEP, as well as international research alliances such as STAR-IDAZ International Research Consortium will enable such cooperation.

2.3.3 How the partnership will establish collaboration with Member States /Associated Countries and national/regional authorities

In the preparatory phase of PAHW, through SCAR and notably CWG AHW, all MS/AC were regularly updated and invited to discuss the PAHW proposal with national RPO, ministries, FO and food agencies where relevant, and to suggest activities for the partnership. The preparation of the PAHW SRIA is jointly done with the ERA-NET ICRAD and in alignment with the European partnership (EUP) One Health-AMR (Cluster 1), as explained before (2.2.8).

The relevant ministries in the Member States and Associated Countries will be represented in the Governance structures of PAHW (see section 3.3).

Furthermore, the existing framework of SCAR and its CWG AHW and SWG SCAR FISH, composed of representatives of the main animal health and welfare research public bodies of over 20 countries (CWG AHW), will ensure a very good level of collaboration with Member States and Associated Countries.

Additionally, the success of past ERA-NETs, as well as the on-going ICRAD ERA-NET, where 31 public research funders/programme owners from 15 member States and 5 non-EU countries are represented, focussing largely on issues relevant to EU policies, is reinforcing the science basis for regulatory framework. Many of the research centres and reference laboratories involved in ICRAD and CWG activities are also partners of the One Health EJP, where a close collaboration with representatives of EFSA, ECDC, FAO, OIE and WHO-Europe has been set up, thus facilitating the envisaged cooperation in the context of PAHW.

In addition, having regular contacts with these national and international stakeholders favours the uptake of PAHW outcomes by these interested parties. It will also help in the dissemination of outputs and outcomes within countries and at the international level.

2.4 Partner composition and target group

2.4.1 How the partnership will build on and strengthen or expand existing collaboration networks and initiatives

The existing networks/consortia CWG AHW (www.scar-cwg-ahw.org), STAR-IDAZ IRC (www.star-idaz.net), DISCONTTOOLS (www.discontools.eu), EPIZONE (www.epizone-eu.net), ICRAD (www.ICRAD.eu), One Health EJP (www.OneHealthEJP.eu) and the

MedVetNet Association (www.mvnassociation.org) support PAHW that will unite research funding organisations, research institutes, reference laboratories and centres for animal health and welfare, as well as, through R&I calls, academic institutions and universities in Europe and more widely at international level.

In order to open up to high-level technologies and new expertise, national funding organisations are invited to take part in PAHW. In that way, R&I calls can be organised to which not only partners, but also universities and private sector (e.g. industrial) partners can apply.

Negotiations are ongoing with the following industrial partners, to discuss on ways to ensure that their needs are considered in PAHW implementation and that they take part in relevant research projects:

- AnimalhealthEurope
- Diagnostics for animals

2.4.2 Type and composition of partners and stakeholder community

At the stage of writing the present document, there are still uncertainties with regards to the involvement of certain entities in the partnerships. While the formal participation of RPOs and FOs is intended, strong attention will be paid to avoid any risk jeopardising the sound implementation of the partnership. Relevant EC services will be consulted in this regard. This shall be clarified in the partnership preparation.

For the understanding of this dossier, the following definitions were adopted:

- Partners of PAHW are members of the partnership consortium; RPO (research centres with activities in the fields covered by PAHW, reference laboratories in animal health and reference centres for animal welfare) and FO (in some cases ministries or agencies are FO); also relevant ministries and food agencies are potential partners.
- Stakeholders have an interest in the outcome of the PAHW; they may have a role in the implementation/governance, but are not partners. Stakeholders may be research performing organizations, relevant ministries or companies (in particular industry) taking part in the initiatives and activities organised by the PAHW like communication and dissemination, trainings and education activities, open R&I calls for transnational research projects, or other activities like setting up databases or sharing infrastructure.

In the PAHW governance (see 3.3), a structure is proposed where partners can exchange with programme owners, with international stakeholders and with industry.

Research and other activities target both regulated animal infectious diseases and priority production diseases, the reinforcement of the animal health part of the One Health approach, and the improvement of welfare of animals. Therefore, the following entities are candidate partners of PAHW:

- Institutes housing national and EU Reference Laboratories (Animal Health/AMR/Food safety) and EU Reference Centres for Animal Welfare.
- National and regional funding organisations, cooperatives and charities/foundations.
- Research centres working on animal diseases and welfare and that provide specific complementary technologies, expertise and capacity (e.g. high containment facilities).

Universities and relevant industry partners (animal sector, diagnostics, pharmaceuticals) can join through open calls.

From the start, as many Member States as possible should join PAHW. The first candidates to reach out to are the interested Associated Countries.

The industry is considered essential for bringing the outputs of PAHW to a higher level and will be associated to PAHW, both as stakeholder and as research actors involved in relevant external open research projects.

2.4.3 List of candidate stakeholders

The stakeholders that will likely benefit most from the outputs of PAHW are policy makers, i.e. the national and regional Ministries that are responsible for animal health and welfare, which will be invited to take part, as well as national and regional food safety organisations, where relevant. These stakeholders will take part in the Stakeholder Committee as is discussed in section 3.3. Relevant EC services will be involved in PAHW as important stakeholder as well.

International bodies, mainly EFSA, ECDC, EEA, OIE, FAO, WHO, UNEP and EMA, will be invited to join the Stakeholders Committee to give strategic input on research and other activities related to animal health and welfare, including zoonotic diseases and AMR.

CWG AHW; EPIZONE; STAR-IDAZ IRC; DISCONTTOOLS; VetBioNet (Veterinary Biocontained facility Network; www.vetbionet.eu), EATiP (European Aquaculture Technology and Innovation Platform; <http://eatip.eu/>), COPA COGECA (European farmers, European agri-cooperatives; www.copa-cogeca.eu), FVE (Federation of Veterinarians of Europe; <https://fve.org>) are considered core PAHW stakeholders.

Other potential stakeholders (will be contacted in course of the development of the proposal):

Animal Health

- EPRUMA (European Platform for the Responsible Using of Medicines in Animals; <https://epruma.eu/>)
- EAVLD (European Association of Veterinary Laboratory Diagnosticians; www.eavld.org/eavld/)
- IABS (International Alliance for Biological Standardization; www.iabs.org)
- FESASS (European Federation of Animal Health Services; www.fesass.eu/)

Animal welfare

- CIWF (Compassion in World Farming, www.ciwf.com/)
- DG SANTE's EU Platform on Animal Welfare (<https://webgate.ec.europa.eu/awp/>)
- Eurogroup for Animals (www.eurogroupforanimals.org/)
- Welfare Quality Network (www.welfarequality.net/en-us/home/)
- EuroFAWC (the European Forum for Animal Welfare Councils, www.eurofawc.com/home/1)
- Universities Federation for animal welfare (<https://www.ufaw.org.uk/about-ufaw/introduction>)
- Four paws/Vier Pfoten <https://www.vier-pfoten.eu/>
- Human Society International <https://www.hsi.org/>

Animal production

- Animal Task Force (<http://animaltaskforce.eu/>)
- FABRE / EFFAB European Forum of Farm Animal Breeders (www.effab.info/)
- FEFANA European Association of Specialty Feed Ingredients and their Mixtures (<https://fefana.org>)
- FEAP: Federation of Aquaculture producers (<https://feap.info/>)
- UECBV: (European Livestock and Meat Traders Union) (<http://www.uecbv.eu/>)
- AVEC : (Poultry Meat Processors) (<https://avec-poultry.eu/>)
- EAAP: European Federation of Animal Science (www.eaap.org)
- TP Organics: the European Technology Platform for organic food & farming (www.tporganics.eu)

Wildlife

- European Wildlife Disease Association (<https://ewda.org/>)
- Wildlife Health Specialist Group (WHSG) of Species Survival Commission (SSC) of the International Union for Conservation of Nature (IUCN) (www.iucn-whsg.org)

Infrastructures: VetBioNet (www.vetbionet.eu/); TRANSVAC2 (www.transvac.org/transvac2); PIGWEB (www.pigweb.eu/); SMARTCOW (www.smartcow.eu/); INFRAVEC2 (<https://infravec2.eu/>); ELIXIR (<https://elixir-europe.org/>)

Other

- MedVetNet Association (www.mvnassociation.org)
- EASVO (European Association of State Veterinary Officers) (www.easvo.fve.org)

This list is not exhaustive nor definitive, and will be finalized during the preparation of the Partnership.

Due to the recognisable link with the EU Partnerships One Health-AMR, Innovative Health, Safe and Sustainable Food Systems for People, Planet and Climate, and Blue Economy, contact will be sought with the respective coordinators to look for collaboration and avoid overlapping activities. They could potentially become stakeholders involved in governance structures of PAHW.

3 Planned Implementation

3.1 Activities

3.1.1 Portfolio of activities

The planned activities can be summarised as follows. More details will be provided in the Strategic Research and Innovation Agenda, which is due by the end of 2022. Not only joint research calls, but also other activities will be set up.

Joint research

Transnational research and innovation calls (R&I calls) will be organised to advance basic and applied knowledge in most of the operational actions of PAHW, and as such foster the preparedness of all actors in animal health and welfare. The R&I calls agenda and content

will be based on the partnership SRIA. Research will focus on, among others, surveillance of animal health and monitoring of welfare, diagnostics, farming practices to improve animal health and welfare, economics, interventions such as vaccines and treatments, and supporting science including pathogen genomes, host-pathogen interactions, epidemiology, ethology, physiology, ecology, biosecurity, immunology, vectors, microbiomes, food safety and AMR (if not addressed by other partnerships). To this end, both open and internal calls will be organised:

- **External open calls:** Funding organizations (FO) will mobilise cash budgets to organise open calls and thus involve e.g. research organizations, academic laboratories and private partners that will be funded according to the FO rules. The aim of open calls is to develop new knowledge, both basic and applied research in the fields of animal health and welfare, which will bring in new expertise and new technologies for e.g. diagnostics, monitoring, treatments or vaccine development, new husbandry practices, biosecurity measures, breeding technologies, etc. Certain call topics may benefit from the participation of stakeholders, including the private sector (for instance research activities with high TRL expectations). To facilitate their involvement in the external projects, clear and transparent guidelines describing what is expected from the stakeholders will be developed.
- Partner RPOs will organise **internal calls** essentially destined to RPO that are beneficiaries of the Grant Agreement. These calls will set up research and integrative ‘trans-RPO’ projects, aiming at reinforcing cooperation and alignment of programmes and activities among reference laboratories, reference centres and research centres, to strengthen prevention and control measures, not least preparedness (surveillance, laboratory, risk assessment and risk management) for animal health and One Health, and by setting up mainly integrative projects also in animal welfare. Such internal R&I calls were organized by the successful Horizon 2020 One Health EJP project, many beneficiaries of which are interested in being part of PAHW. The organisation of such calls will follow a transparent and impartial process among RPOs submitting proposals to address needs described in the SRIA. Internal calls are EC co-funded and each participating RPO will contribute through in-kind funding of the projects in which they are involved. Actors that are not beneficiaries of the Partnership Grant Agreement may also take part, either at their own resources, or as linked third-parties, or through sub-contracting. Probably, the areas of the internal calls will focus on applied, policy driven research i.e. priority regulated health and/or welfare issues, e.g. for AID: zoonoses, vector-borne infections and AMR (in alignment with domains and topics as defined in the European partnership One Health-AMR), including reference tasks, infections/diseases where no EU-RL exist.

RPO members of PAHW may wish not only to take part in research performed internally but also to apply to external open calls. In order to enable this but avoid conflict of interest - CoI (i.e. that RPO within PAHW would have privileged access to external open call topics), the proposed provisions on governance are described below (3.3. Governance).

Integrative activities

Another series of activities will be focussing on the integration of RPO actors within PAHW, and deal with laboratory, risk assessment and risk management work and the means to support preparedness (prevent-detect-response) of all partners involved. These activities may also be organized through calls. Integrative activities are EC co-funded and each participating RPO will contribute through in-kind funding of the activities in which they are involved.

- **Shared infrastructure** (e.g. animal facilities or laboratories of BSL2 or higher).

- **Shared repositories** (e.g. collections of biological and genetic material, in line with Nagoya protocol) are needed when developing and validating new tests and for organising ring trials / proficiency testing to align and harmonise procedures.
- Open access, cross-border and cross-sector **animal health databases and (if possible) animal welfare** will be set up that can be linked to existing databases, including those related to public health (e.g. ECDC, EFSA, FAO and OIE).
- **Capacity building** of diagnostic and research laboratories and regarding welfare assessment and monitoring by organizing harmonization and standardization efforts and proficiency tests, inventories of databases and of existing technology networks of common interest, a patent service to protect project outcomes and to support regulatory aspects, etc.

Other joint activities

Besides the external open and internal R&I calls, other joint activities will be set up. The communication, dissemination and exploitation events are based on the outputs of the partnership, as well as on experience and expertise of its partners. These activities will expand as the PAHW moves on. Communication should be balanced on animal health, animal welfare (across all animal species) and One Health. These joint activities are EC co-funded and each participating RPO will contribute through in-kind funding of the activities in which they are involved.

- Consultation **meetings with stakeholders and interested parties** will be organised to identify needs and gaps identified by scientists and policy makers, but also the broader community of farmers, veterinarians and the consumer, and will contribute to the regular update of the SRIA.
- **Education and training activities** (e.g. events like dissemination workshops and summer schools, early career workshops for young researchers, scientific meetings, short term missions, creation of a ‘Young PAHW Community, ‘stable schools’ where farmers and veterinarians can exchange needs, challenges and solutions, demonstration opportunities, etc.) will be set up. Other formats are envisaged as well, e.g. training material (leaflets and brochures on the projects funded with focus on the main outputs, video’s that explain the project deliverables, their use and possible uptake by others, etc.), dedicated webpages, knowledge hubs, etc. Certification of education activities should be considered.
- **Dissemination and communication** on activities: both scientific conferences and communication of the outcome to a larger public, disseminate outcomes in policy briefs, etc. An encompassing communication strategy will be set up to identify the main outputs to disseminate, the most susceptible audience, along a suitable time line.
- **Exploitation** regarding uptake of PAHW outputs by partners, but also RPO that are not part of the PAHW, by risk assessors, risk managers, and by the industry.

3.1.2 Complementarity mechanisms, avoid unnecessary duplications

The key to avoiding overlap and duplication of work is coordination among partners. Therefore, it is important to have most of the PAHW partners on board when organizing joint activities. By timely consultation with the authorities, there will be a broad basis for the endorsement of planned activities. Such discussions should be held in a transparent way, to further avoid unintended duplication of work.

In the European animal health and welfare community, there is a positive experience of coordination of public research programmes, in particular through CWG AHW, ERA-NETs,

or One Health EJP. This coordination will be lifted to a superior level, with intended integration of relevant actors, and mobilisation of critical mass and resources. RPO and FO that already collaborate in existing animal health and welfare consortia (i.e. CWG AHW, STAR-IDAZ IRC, DISCONTTOOLS, EPIZONE, ICRAD and One Health EJP) are expected to be stakeholders of PAHW and will thus add their research and network achievements in order to further implement coordination of new research activities and avoid duplication of research.

Certain activities planned in PAHW (see 3.1.1) precisely aim to reduce duplication and rather facilitate synergies, such as harmonisation of standards and methods and installing pan-European databases, repositories and systems.

In order to facilitate interaction and complementarity with other European partnerships (i.e. Biodiversity, Safe and Sustainable Food Systems, Agroecology, One Health-AMR and Pandemic Preparedness), their representation in relevant PAHW governance structures is foreseen.

The following European Partnerships (EUP) have been identified for possible alignment.

- Candidate EUP One Health-AMR: while the One Health approach is relevant for epidemiology, surveillance, detection, possibly stewardship of AMR, measures to fight against AMR in the animal domain, aimed at reducing the (need to) use of AMs, and replacing AMs, will be tackled in PAHW. Also working on AMR epidemiology for animal pathogens is planned. At this stage, One Health-AMR partnership is planned for call 2024; alignment of the planned activities in both Partnerships are being discussed with JPIAMR representatives to avoid overlaps and foster synergies instead. Interaction also with the Coordination and Support Action to be selected to prepare the EUP One Health-AMR (topic in Cluster 1 Work-Programme 2021) will be organised from 2022 onwards, in respect of SRIA development. Reciprocal participation in Advisory structures of both partnerships can be proposed. Reporting on programme, activities and outputs can be ensured. The possibility of coordinated calls could be considered.
- Candidate EUP Pandemic Preparedness: Contacts with representatives of INSERM in France and ISCIII in Spain are ongoing to identify possible common interests and to understand where possible activities regarding animal health and One Health may overlap between both partnerships. At this stage, this Cluster 1 partnership is planned for call 2024; interaction with the Coordination and Support Action to be selected to prepare the EUP Pandemic Preparedness partnership (topic in Cluster 1 Work-Programme 2021) will be organised from 2022 onwards.
- Biodiversa-Plus: it is understood that this partnership is planning a flagship on biodiversity and health, but not within the first 2 years of operation. Interaction with Biodiversa-Plus will be organised in the process of SRIA development in 2022.
- Candidate EUP Agroecology: this partnership, like PAHW is planned for call 2023; coordination will take place in the process of development of respective SRIAs. This partnership will also include organic farming and animal welfare actions, in line with one of its guiding principles for implementation.
- Candidate EUP Safe and Sustainable Food Systems (SSFS): PAHW intends to address food safety hazards at primary production, addressing both AID that are food-borne zoonoses, and by extension also food-borne pathogens that may not cause diseases in animals but of which animals are reservoirs. Coordination with EU Partnership SSFS will depend on the boundaries of this partnership.

- Candidate EUP Blue Economy: it is expected that no substantial work on animal health and welfare in aquatic animals will be addressed in that partnership, as PAHW intends to address both terrestrials and aquatic animals. Coordination will notably take place through discussion among SCAR CWG AHW and SCAR Fish.
- Candidate EUP Innovative Health (planned follow-up to IMI-2): coordination may be useful to look for synergies between the medical and the veterinary sectors in specific domains, e.g.; infectious diseases, including zoonoses; innovative technologies; animal models.

Coordination with other pillars of Horizon 2020:

- Pillar I - Research infrastructures: PAHW will collaborate with relevant existing Research Infrastructures or their possible successors (e.g. [ELIXIR](#), [VETBIONET](#), [INFRAVEC2](#), [AQUAAXCEL2020](#), [TRANSVAC](#): TRANSVAC2 and TRANSVAC-DS), and see how they can contribute.
- Pillar III
 - Innovation ecosystems: collaboration will be explored. PAHW intends to contribute to the development of innovative (animal health) products and services.
- EIT: To be explored (e.g. KIC Health, KIC Food).

Coordination with JPIAMR is on-going; interaction with JPI HDHL, JPI Ocean, JPI FACCE is to be explored.

At this stage there does not seem to be relevant Horizon Europe missions to cooperate with.

Synergies with other Programmes is at this stage not yet discussed, nor the possibility to obtain funding through other sources such as charities, but this may arise once the PAHW partners are confirmed and the consortium is built.

3.2 Resources

3.2.1 Contributions from partners

The proposed format enables resources both in kind (through RPO members of the PAHW consortium) and in cash (through FO members of the PAHW consortium).

The available budget will be known once the commitments by countries is provided early in 2022. The distribution of the budget and the contributions in cash and in kind to carry out PAHW tasks and actions will be further elaborated during the SRIA and partnership preparation.

As mentioned above (2.2.5), the total amount of R&I investments necessary to reach the objectives and expected impact of PAHW would be roughly €400 million. Obviously, more could be done if more budget becomes available. If a lower budget would be available, reducing the scope of PAHW would be required.

Coordination tasks for such large initiative must not be underestimated, especially considering the combined mode of operation with RPO and FO in the consortium and related organisation of internal calls and activities that will be performed via external open calls.

3.2.2 Other investments or conditions

Beyond scientific progress, the impact of the partnership will depend on the level of uptake of outputs by stakeholders, users, related initiatives; from laboratories to industry, to decision makers, to veterinarians and farmers and related services. The strategic objectives described,

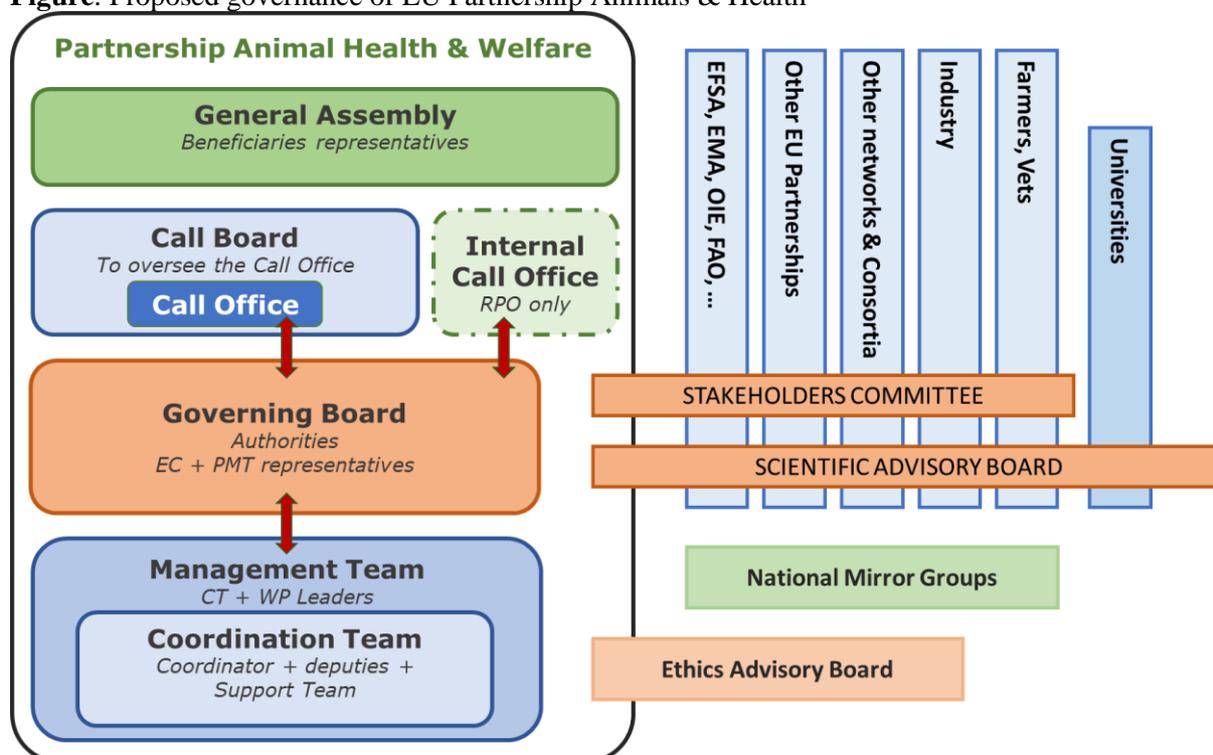

together with the ‘other activities’, including dissemination and communication, explain the efforts that PAHW plan to facilitate uptake and reach the expected impact.

3.3 Governance

3.3.1 Governance and advisory structures

At this stage, where exploratory discussions have taken place with some potential RPO, FO and ministry partners, including with the private sector, a co-funded partnership model centred on public research actors is proposed. The following governing and advisory structures are suggested, which will be further discussed at the PAHW proposal phase. The proposed governance of the Partnership will be further elaborated being a central aspect of the future Consortium Agreement. It will take into account the diverse contributions from the partners and the need to facilitate an efficient uptake of the results of the Partnership.

Figure: Proposed governance of EU Partnership Animals & Health

The **General Assembly (GenA)** is composed of all partners/beneficiaries of PAHW, one representative per partner. It will be yearly informed about the progress of PAHW and is the ultimate decision making body dealing with the Grant Agreement (GA). For other decisions the GovB will decide. The GenA will strive to reach consensus and if consensus cannot be reached, the GenA will vote on different options. GenA Quorum and voting arrangements will be elaborated on in the Consortium Agreement.

The **Governing Board (GovB)** is the highest strategic and decision making body to oversee the partnership SRIA, its updates and operationalisation, the available resources, the work programme including the open and internal call domains, the structure and information flow and to monitor the possible outcome and the expected impact of the PAHW. It is composed of two national and/or regional authorities per country that represent the main AH&W FO on one side, and RPO on the other side (in countries where both FO and RPO would be partners of the PAHW), while excluding collaborators from AH&W RPO research units. To optimize interaction between AH&W actors and ensure representativeness in the GovB, AH&W National Mirror Groups should be set up in each country (see below). In addition, the GovB consists of representatives from the EC services, and from other advisory and stakeholders

organizations. The GovB will regularly consult the Stakeholders Committee and /or the Scientific Advisory Board. The participation of Partnership Management Team (PMT, see below) in GovB meetings, the role of GovB Chairs, GovB quorum and voting arrangements will be elaborated in the Consortium Agreement.

The GovB has a strategic role to ensure consistency and completeness in the implementation of the PAHW SRIA through internal calls and external open calls, as well as through integrative and other joint activities (among others: frequent exchange with stakeholders including industry, education and training actions, etc.) in addition to monitoring of the progress and providing advice to the Partnership Management Team. The GovB will define the high-level domains of the R&I calls, whereas the precise call topics will be defined by the Call Board.

The **Partnership Management Team (PMT)**, composed of the Coordination Team and all WP leaders, will be the forum to discuss details of the PAHW progress, annual work plans, use of related resources and to prepare the GovB meetings. PMT will meet regularly.

The **Coordination Team (CT)** will consist of the coordinator and Coordinator deputies, one or more project managers, communication officer, financial and legal officer and assistants. The CT is the central body and will carry out the day-to-day operational management by supporting PAHW partners and is also responsible for the active monitoring of the PAHW progress (KPI). CT will meet frequently, e.g. every week.

The **Call Board (CB) and Call Office**. The Call Board is composed of FO and RPO (and authorities, to be decided) in a variable configuration, depending on the call (in order to avoid CoI). Based on the call domain as decided by the GovB, the CB will define the call text that includes the call topics, and will oversee the organization of the R&I calls by the Call Office. For the external open calls, FO will propose the topics, whereas for the internal calls, the call topics will be proposed by RPO. The CB may consult the Stakeholders Committee and the Scientific Advisory Board. The CB will use a defined methodology (e.g. Multi Criteria Decision Analysis, Delphi studies or similar) to decide on the final call topics. It will supervise the Call Office that will collect pre- and full proposals, organize the external independent evaluation and list the project proposals for funding, according to harmonized procedures for open and internal calls. The CB will select the project proposals and the GovB will validate that choice when in line with the SRIA and domain of the call, the PAHW strategy and available budget. The GovB also has a role in arbitrage (complaint procedure, to be developed).

To avoid CoI, should a RPO be involved in the CB or Call Office that manages a particular call, that RPO cannot take part in the projects of that call, be it open or internal call. Another option would be that RPO manage the internal call independently from external open calls, without intervention of FO (and Ministries, to be decided).

National AH&W Mirror Groups. Participating countries are strongly encouraged to constitute national Mirror Groups, bringing together the national and regional AH&W FO, RPO, authorities, experts and other relevant stakeholders (e.g. farmers and veterinarians, sectors, etc.). Their role is to ensure national coordination, contribute to the objectives of the Partnership and facilitate uptake of the partnership outcomes. The composition of an NMG is at the discretion of each participating country. Each Mirror Group should decide on the delegates in the GovB (authorities that represent FO and RPO, excluding collaborators from AH&W RPO research units). In the absence of NMG, ad hoc decisions on what entities should take part in the GovB will be made when preparing the PAHW proposal.

Ethics Advisory Board (EAB): With the aim of complying with the European ethical and legal frameworks, independent, external experts will be appointed in charge of advising on and monitoring ethical/ legal (including CoI)/ regulatory issues of the Partnership, of the Data Management Plan, as well as of the projects funded within Partnership.

Scientific Advisory Board (SAB): The SAB is invited by the GovB or/and Call Board for giving input to the research strategy, for joint transnational calls or other activities. The SAB consists of international experts from universities, RPO outside PAHW partners or similar, with expertise in the fields addressed in PAHW animal health and welfare. Composition and modus operandi will be established in due course.

The **Stakeholders Committee** is composed of representatives of all stakeholder organizations. They will regularly share their expertise, advice and recommendations for inclusion in the PAHW activities. Composition and modus operandi will be established in due course. Subgroups may be established depending on the type of stakeholders and the interactions expected (e.g. the animal health industry may have a special role for providing advice on framework conditions for performing experiments in order to facilitate uptake of results to bring them to a further stage of product development; welfare organizations may be consulted on societal interest in particular priorities).

3.3.2 Involvement of the European Commission

A strong and smooth collaboration with the European Commission services will be key in order to ease the implementation and administration of the partnership. The EC role will also be to follow the preparation of the annual work plans, the implementation and regular updating of the SRIA/Roadmap and to assess which areas may be addressed by topics in the Horizon Europe work-programmes rather than in the partnership, as complementary approach. The EC will also ensure that appropriate interaction takes place with other relevant European partnerships and that EU and international policy developments are brought to the attention of the partnership.

DG AGRI, as lead DG for this partnership, and other relevant EC services will be invited to take part in the Governing Board meetings as observers (details to be discussed).

In addition to the role of certain Commission Services as observers in the Governing Board, the EC steering role will be decided at a later stage of preparation of the partnership: either through an external Steering Group (as implemented for certain Horizon 2020 European Joint Programme co-funds), or as part of a European Mirror Group in PAHW. This group would bring together a wider network of EC bodies that have an interest in the activities of the Partnership and would include DG AGRI, as well as other relevant DGs (e.g. DG SANTE, DG RTD, DG MARE etc.). This would facilitate a two-way flow of information, from the GB to the relevant DGs/JRC and vice versa.

3.4 Openness and transparency

3.4.1 How will the partnership establish a broad, open and transparent approach towards different sectors and geographical areas

Ensuring involvement of all relevant actors (as partner or as stakeholder) is at the core of the partnership. The discussions so far involved SCAR CWG AHW, SCAR Fish, SCAR Steering Group, together with representatives from different projects, initiatives and bodies like e.g. One Health EJP, EPIZONE, STAR-IDAZ IRC, ICRAD ERA-NET, OIE, EFSA, plus the experts in the working group that proposed detailed objectives and activities. On the industry side, exploratory discussions were held with AnimalhealthEurope and Diagnostics for Animals, as perceived main actors. The member States and Associated Countries will be consulted by the EC (DG RTD).

It is intended to further organise discussions with(in) the above-mentioned consortia and other experts and to organise more inclusive discussions in coordination with Commission Services on the basis of the present dossier, in order to refine the preparation of the activities and governance of the partnership.

The participation of research actors in transnational projects selected through external calls will ensure a high level of inclusiveness as regards sectors and geographical areas, next to the RPO that will be part of the PAHW consortium. In addition, new partners will be able to join the PAHW consortium, subject to amendment of the Grant Agreement: additional FO will always be able to join for funding external calls, while RPO may join if their expertise/mandate fits the criteria of PAHW for internal activities. Particular efforts will be devoted to involve actors in lower performing countries in PAHW. Consideration will be given to reserve part of the budget during the first years, for potential additional partners.

The stakeholders listed in section 2.4.2 will be invited to take part.

3.4.2 How will the partnership ensure easy and non-discriminatory access to information about the initiative and dissemination of and access to results

Once PAHW will be established, a dedicated website will be set up where the SRIA and the outputs of the R&I activities will be published. Furthermore, webinars, regular workshop, conference and meeting will be organised for the research community. Their results together with main results of R&I activities will be disseminated throughout appropriate communications channels for a wider audience of stakeholders. The current document (PAHW proposal, version December 2021) will be published on the CWG AHW website.

A Communication and Dissemination Plan will be developed and implemented together with experts in scientific communication. The plan will specify the different tools for effective communication with different stakeholders such as: social media for researchers, programme owners, citizens (LinkedIn, research gate, Facebook, Twitter...), newsletters, brief policy advice, posts, press news, etc. Specific efforts should be put in the communication and dissemination of outputs and outcomes to professional non-research parties (regional, national and international authorities, sectors, industries, etc.) and to the public, who has a specific interest in improving the welfare of livestock and fish.

A PAHW publication policy will be drafted with guidelines for optimal dissemination of scientific manuscripts. All publications and deliverables will be made publicly available following the Open Science and FAIR principles.

3.4.3 How will the partnership establish a proactive recruitment policy

This will be determined during further discussions on the final PAHW proposal.

At this stage, the main candidate partners should be aware of the construction of PAHW, since, besides the many EC efforts to communicate on Horizon Europe and its Partnerships, the CWG AHW was regularly updated on the progress of the PAHW dossier. In addition, DG AGRI has organised a stakeholder webinar in June 2021 and a TC in mid-December 2021. Therefore, many stakeholders are already identified and contacted and will be associated in the further preparation of the partnership.

As regards potential partners from the public sector, it is expected that the representatives in SCAR CWG AHW, as well as the contact persons identified by the Member States / associated countries for this partnership and who were associated to the discussions, have been ensuring coordination within their own country. A proactive policy to stimulate the participation of countries not yet part of PAHW will be undertaken.

On the industry side, contacts were made with two important European/International Associations that represent a vast majority of the actors in their domain. Depending on the possible development of objectives in areas where other private actors would be useful, these will be contacted as well.

3.4.3 Process for establishing annual work programmes

This should be determined during the development of the SRIA.

The first AWP will be based on the SRIA and both documents will be updated through input of the Scientific Advisory Board and the Stakeholder Committee.

Annexe 1 Contributions

CWG Animal Health & Welfare

The CWG AHW was closely involved in the preparation of this document, and is composed of Funding Organizations, Research Performing Organizations and experts from the following countries: Austria, Belgium, Croatia, Czech Republic, Denmark, Finland, France, Germany, Greece, Hungary, Ireland, Israel, Italy, Lithuania, Luxembourg, The Netherlands, Norway, Poland, Portugal, Russia, Slovakia, Spain, Sweden, Turkey and the United Kingdom.

Among its observers are: AnimalhealthEurope, COPA-COGECA, COST, EFSA, the European Commission and OIE.

Collaborating entities

In the preparation of the drafting of this document, contact has been taken with the following entities: DISCONTTOOLS, EATiP, EPIZONE, FVE, ICRAD, MedVetNet Association, One Health EJP, STAR-IDAZ IRC and VetBioNet.

Working groups

WG Surveillance: Lead Yves van der Stede (EFSA) and Dolores Gavier-Widén (SVA, SE); Kiara Ailello Holden (EFSA), Julio Alvarez Sanchez (Visavet, ES), Silvia Bellini (IZSLER, IT), Clémence Foltz (EFSA), José Gonzales Rojas (WUR, NL), Wim van de Poel (WUR, NL), Arvo Viltrop (EMU, EE)

WG Diagnostics: Lead Pikka Jokelainen (SSI, DK), Bruno Garin-Bastuji (ANSES, FR) and Martin Beer (FLI, DE); and Alain Boissy (ANSES, FR), Isabella Monne (IZS Venezia, IT), Isabelle Behaeghel (Sciensano, BE), Johannes Charlier (DISCONTTOOLS), Kris De Clercq (Sciensano, BE), Marc Tabouret ANSES, FR), Miklós Gyuranecz (HIVMR, HU), Stephen Hennart (Diagnostics4Animals), Hans Nauwynck (UGent, BE), Wim van der Poel (WUR, NL), Stéphan Zientara (ANSES, FR).

WG Farming practices: Lead Kristian Møller (SEGES, DK) and Virginie Michel (ANSES, FR); Poul Bækbo (SEGES, DK), Laura Boyle (TEAGASC, IE), Carlo Corradini (IZSILT, IT), Adam Drosio (COGECA), Nadav Galon (IL), Vivi Hunnicke Nielsen (AU, DK), Alexandra Jeremiasson (FORMAS, SE), Marianne Berthelot (ANSES, FR), Palić Dušan (VetMed Uni, DE), Marie-Hélène Pinard-van der Laan (INRAE, FR), Hans Spoolder (WUR, NL), Antonio Velarde (IRTA, ES)

WG Treatment & Vaccines: Lead Sven Arnouts (UGent, BE) and Alex Morrow (CABI, UK); Artur Summerfield (Vet Suisse, CH), Edwin Claerebout (UGent, BE), Eric Cox (UGent), Jens Nielsen (DTU, DK), Madsen Lone (DTU, DK), Luca Guardabassi (SUND, DK), Amedeo Manfrin (IZS Venezia, IT), Paul Midtlyng (NMBU, NO), Sabine Riffault (INRAE, FR)

WG Antimicrobial resistance: Lead Annemarie Kaesbohrer (BfR, DE) and Roberto La Ragione (U Surrey, UK); Julio Alvarez Sanchez (Visavet, ES), Rudolphe MADER (FAO), Beatriz Guerra (EFSA), Ernesto Liebana (EFSA), Jeroen Dewulf (UGent, BE), Claire Chauvin (ANSES, FR), Jean-Yves Madec (ANSES, FR)

WG Aquaculture: Lead Marina Bagni (MoH, IT) and Giuseppe Arcangeli (IZS Venezia, IT); Aida Campos (IPMA, PT), Amedeo Manfrin (IZS Venezia, IT), Carlo Corradini (IZSLT, IT), Kjersti Fjalestad (SWG Fish, NO), Dennis Lisbjerg (EFARO, DK), Aurelio Ortega Garcia (IEO, ES), Ricardo Calado (UA, PT), Edgar Brun (VetInst, NO), Niccolò Vendramin (DTU, DK)
